**OKLAHOMA**
Soil Moisture Accounting Component of the USDAHL-74 Model of Watershed Hydrology
W75-11656 2G

Rate of Phosphorus Sorption by Five Oklahoma Soils,
W75-11836 3F

**OLIGOCHAETES**
Oligochaetes in the Bottom Fauna and Stomach Content of Trout, Salmo Trutta (L.),
W75-11385 2H

**ON-SITE TESTS**
Field Test of Soil Water Flux Meters.
W75-11586 2G

**OPEN CHANNEL FLOW**
Simulation of Dispersion of Suspended Particles,
W75-11782 8B

**OPERATIONS**
Package Plant Owner Responsibility and Operation of Small Sewage Units,
W75-11688 5D

**OPTIMIZATION**
Optimizing Water Utilization Through Multiple Crops Scheduling,
W75-11587 3F

**OPTIMUM USE**
Determining Optimal Well Discharge,
W75-11768 4B

**OREGON**
Ground-Water Data in the Harrisburg - Halsey Area, Central Willamette Valley, Oregon,
W75-11498 7C

Advanced Wastewater Treatment Plant with Designed-In Reliability,
W75-11700 5D

**OREGON COAST RANGE**
Soil and Hydrologic Factors Affecting the Stability of Natural Slopes in the Oregon Coast Range,
W75-11353 2G

**OREOXEROPHYTES**
Transpiration of Some Oreoxerophytes of the Central Caucasus, (In Georgian),
W75-11442 2D

**ORGANIC COMPOUNDS**
Organochlorine Compounds in Several Marine Organisms from the North Sea and the Dutch Wadden Sea,
W75-11608 5B

Hydrocarbons Associated with Suspended Particulate Matter in San Francisco Bay Waters,
W75-11614 5A

The Brown Pelican and Certain Environmental Pollutants in Louisiana,
W75-11757 5A

Elimination of Hydrocarbons by Mussels,
W75-11760 5C

Studies of the Aromatic Compounds Content in Sea Water by Low-Temperature Luminescen Spectroscopy, (In Russian),
W75-11786 5A

**ORGANIC FILMS**
Formation and Collapse of Surface Films,
W75-11642 2K

**ORGANIC PESTICIDES**
Influence of Some Biocides Employed in the Wood-Processing Industry on Growth of Green Algae,
W75-11605 5C

**ORGANIC WASTES**
Elimination of Water Surface Pollution.
W75-11416 5D

**ORNITHOCENOSIS**
Effects of Fish-Ponds Near Jakubovo on the Ornithocenose There, (In Czech),
W75-11535 5C

**OSMOREGULATION**
Synergistic Effects of Salinity, Temperature and Heavy Metals on Mortality and Osmoregulation in Marine and Estuarine Isopods (Crustacea),
W75-11610 5C

**OVERLAY MAPPING**
Procedure for Selecting a Minimal Environmental Impact Routing for a Water Conveyance Canal,
W75-11764 6G

**OXIDATION**
Sewage Oxidation Treatment Apparatus,
W75-11395 5D

Domestic Sewage System,
W75-11509 5D

Iron and Manganese Removal with Ozone, Part I,
W75-11693 5F

The Influence of Temperature on the Biological Oxidation of Urban Waste Waters by Means of an Activated Sludge (Influenza Della Temperature Nella Ossidazion Biologica dei Liquami Urbani Mediante Fanghi Attivi),
W75-11745 5D

A Design and Economic Evaluation of Wet-Air and Catalytic Oxidation of Sewage Sludge,
W75-11784 5D

The Influence of Particle Size on Oxidation of Total, Soluble, and Particulate Municipal Wastewater Components by Ozone,
W75-11850 5D

**OXYGEN**
EPA Experiences in Oxygen-Activated Sludge,
W75-11738 5D

**OXYGENATION**
Oxygenation of Waste Water,
W75-11681 5D

**OYSTERS**
The Estimation of the Amount of Empire Mix Crude Oil in Mullet, Shrimp, and Oysters by Liquid Chromatography,
W75-11613 5A

**OZONE**
Waste Water Treatment System With An Ozone Generator,
W75-11426 5D

Domestic Water Purification Method and System,
W75-11427 5D

Iron and Manganese Removal with Ozone, Part I,
W75-11693 5F

The Influence of Particle Size on Oxidation of Total, Soluble, and Particulate Municipal Wastewater Components by Ozone,
W75-11850 5D

**OZONE GENERATOR**
Waste Water Treatment System With An Ozone Generator,
W75-11426 5D

Domestic Water Purification Method and System,
W75-11427 5D

**PACIFIC OCEAN**
Western North Pacific Typhoons, 1974,
W75-11578 2B

Central North Pacific Tropical Cyclones, 1974,
W75-11579 2B

**PACIFIC SLOPE BASINS (CALIF)**
Quality of Surface Waters of the United States, 1970: Part II. Pacific Slope Basins in California.
W75-11485 7C

**PACIFIC SLOPE BASINS (WASH)**
Surface Water Supply of the United States, 1966-70: Part 12. Pacific Slope Basins in Washington--Volume 1. Pacific slope Basins in Washington Except Columbia River Basin.
W75-11490 7C

**PACKAGE PLANT SEWAGE UNITS**
Package Plant Owner Responsibility and Operation of Small Sewage Units,
W75-11688 5D

**PACKAGE TREATMENT PLANTS**
Sewage Treatment.
W75-11398 5D

**PACKED BEDS**
They're Packing up Waste Ponds.
W75-11703 5D

**PADAN**
The Crystal and Molecular Structure of Selected Pesticidal Water Pollutants,
W75-11351 5A

**PASTEURIZATION**
Pasteurization of Sapropel (Pasteurisierung von Faulschlamm),
W75-11750 5D

**PATENTS**
Method for Reclaiming Industrial Wastes and Eliminating Pollution,
W75-11367 5D

Dehydrating Industrial Sludges by Filtration.
W75-11369 5D

Method of Purifying Water,
W75-11379 5D

Continuous Treatment of Polluted Liquids.
W75-11381 5D

Process for Treating Waste Water,
W75-11387 5D

Detector of Trace Substance in Water,
W75-11388 5A

Sewage Oxidation Treatment Apparatus,
W75-11395 5D

Activated Sludge Sewage Treatment for Seasonally Variable Throughput,
W75-11396 5D

Separating Ionised Materials from Aqueous Solutions.
W75-11397 5D

Sewage Treatment.
W75-11398 5D

Single Tank Sewage Treatment Plant,
W75-11399 5D

Elimination of Water Surface Pollution.
W75-11416 5D

Valve for Controlling Liquid Discharge.
W75-11417 8C

Filtration and Purification of Contaminated Water,
W75-11418 5D

Open Water Purification System,
W75-11419 5D

Use of Oxidized Cationic Starch in Flocculation and Dewatering of Municipal Sludge,
W75-11420 5D

Water Processing Plant to Controlled Acidity Level,
W75-11421 5F

Electrolytic Chlorine Used to Purify Disintegrated Sewage.
W75-11422 5D

Sludge Dewatering Installation.
W75-11424 5D

Waste Water Treatment System With An Ozone Generator.
W75-11426 5D

Domestic Water Purification Method and System,
W75-11427 5D

Removing Solids From Sewage.
W75-11428 5D

Irradiation Plant for Fluid Material, Particularly Sewage Sludge.
W75-11430 5D

Continuous Determination of Toxicity of Effluents.
W75-11431 5A

Apparatus for Providing a Statistical Count of Particulate Material in a Fluid,
W75-11434 5A

Apparatus for Cleaning Loose Filtering Material in Slow Water Filled Water Supply Filters,
W75-11436 5F

Flotation Aerator for Aerating and Moving Water,
W75-11439 5D

Incinerator Device and a Method of Processing Residuals in Waste Water, Liquefied Sewage and Sludge,
W75-11440 5D

Liquid Treatment Plant and Process Particularly for Waste Water.
W75-11441 5D

Sewage Treatment with Hydrogen Peroxide.
W75-11443 5D

**PATENTS**

Treating Effluent.
W75-11444 5D

Method for Combatting Pollution Using a Chromium Complex,
W75-11506 5G

Aerobic Sewage Treatment System,
W75-11507 5D

Sewage Treatment Device,
W75-11508 5D

Domestic Sewage System,
W75-11509 5D

Sewage Treatment System,
W75-11510 5D

Sewage Disposal System,
W75-11511 5D

Apparatus for Sewer Treatment to Kill Three Roots and Other Organic Growth Therewithin,
W75-11513 5G

Sewage and Garbage Disposal.
W75-11514 5D

Desalination of Water.
W75-11515 3A

Treating Sewage.
W75-11516 5D

Irradiation Plant for Fluid Matl Partic Sewage Sludge.
W75-11517 5D

Horizontal Reactor for Polymsn. Sewage Oxidation Etc.,
W75-11518 5D

Device and Method for Conducting Waste Liquid from a Receptacle to a Pneumatic Liquid Disposal System,
W75-11519 5D

Liquid Treatment Apparatus Having Combined Reaction Basin and Clarifier,
W75-11521 5D

Sewage Disposal Process,
W75-11522 5D

Sewage Biological Processing,
W75-11658 5D

Waste Water and Sewage Purification.
W75-11659 5D

Biological and Chemical Purification Plant.
W75-11660 5D

Domestic Waste Water and Sewage Evacuation Device.
W75-11661 5D

Solidification of Sewage Sludge to a Hard Material.
W75-11662 5D

Waste Water Purification.
W75-11663 5D

Sewage Treatment Plant Equipped With an Aeration Impeller,
W75-11670 5D

Means for and Method of Purifying Contaminated Water,
W75-11672 5D

Purifying Plant for Sewage,
W75-11673 5D

Desalination,
W75-11675 3A

Centrifugal Compressor-Melter for Desalination of Water.
W75-11676 3A

Sewer Branch Saddle Connector,
W75-11677 8C

Centrifugal Pump for Processing Liquids Containing Abrasive Constitutents, More Particularly, a Sand Pump of a Wastewater Pumper,
W75-11679 5D

Air Driven Rotating Biological Contactor Apparatus,
W75-11680 5D

Oxygenation of Waste Water,
W75-11681 5D

Biological Purification of Waste Water.
W75-11683 5D

Sewer Line Blow-Out Plug,
W75-11684 8C

Sewage Treatment Process,
W75-11685 5D

**PATH OF POLLUTANTS**

Transport Model, User's Manual,
W75-11468 5B

Selenium in Waters in and Adjacent to the Kendrick Project, Natrona County, Wyoming,
W75-11492 5B

Geochemistry of Surface Sediments in an Acid Stream Estuary,
W75-11531 2J

Kinetics of Lead Retention and Distribution in Suckling and Adult Rats,
W75-11537 5B

Copper Uptake and Excretion by Busycon Canaliculatum L.,
W75-11755 5C

A Steady-State Model of Isotopic Fractionation Accompanying Nitrogen Transformations in Soil,
W75-11831 5B

**PEAK DISCHARGE**

Progress Report to the Arkansas State Highway Commission for Year Ending June 30, 1975,
W75-11501 8B

**PEANUTS**

Effects of Soil Temperature and Soil Moisture in Podding Zone on Pod Development of Peanut Plants, (In Japanese),
W75-11456 3F

**PELICANS**

The Brown Pelican and Certain Environmental Pollutants in Louisiana,
W75-11757 5A

**PENMAN'S EQUATION**

Modified Penman Equation to Provide the Upper Boundary Condition in Computing Evaporation from Soil,
W75-11598 2D

**PENNINES**

Evapotranspiration and Soil Moisture in Upland Grass Catchments in the Eastern Pennines,
W75-11648 2D

**PENNSYLVANIA**

Prediction of Flood Volume from Small Humid Region Watersheds.
W75-11462 4A

**PERFORMANCE**

Water Harvesting Catchments on Indian Lands in the Southwest,
W75-11809 3B

**PESTICIDES**

The Crystal and Molecular Structure of Selected Pesticidal Water Pollutants,
W75-11351 5A

Influence of Some Biocides Employed in the Wood-Processing Industry on Growth of Green Algae,
W75-11605 5C

**PHENYL MERCURY CHLORIDE**

Biliary Excretion of Phenyl and Methyl Mercury Chlorides and Their Enterohepatic Circulation in Rats,
W75-11525 5C

**PHOSPHATE REMOVAL**

Removal of Phosphates and Metals from Sewage Sludges,
W75-11729 5D

**PHOSPHATES**

Natural and Accelerated Phosphate Mobility, (In Dutch),
W75-11520 5C

Sludges Generated in Phosphate Removal Processes,
W75-11737 5D

**PHOSPHOROUS**

Swedish Experiences in Chemical Treatment of Wastewater,
W75-11694 5D

**PHOSPHORUS**

Liquid Treatment Plant and Process Particularly for Waste Water,
W75-11441 5D

Rice Response to Nitrogen and Phosphorus in Flooded and Nonflooded Soils,
W75-11597 3F

Recycling of Incinerator Ash,
W75-11714 5E

Rate of Phosphorus Sorption by Five Oklahoma Soils,
W75-11836 3E

**PHOTOSYNTHESIS**

Decomposition of Urea Associated with Photosynthesis of Phytoplankton in Coastal Waters,
W75-11612 5C

Effect of Water Stress, Temperature, and Light on Photosynthesis in Alder Seedlings,
W75-11691 2

**PHYSICAL-CHEMICAL PROCESSES**

Metal Removal by Physical and Chemical Treatment Processes,
W75-11542 5

**PHYSICO-CHEMICAL TREATMENT**

An Evaluation of the Effectiveness and Applicability of Physical-Chemical Treatment of Urban Land Runoff,
W75-11389 5

The Physico-Chemical Treatment of Crude Sewage,
W75-11404 5D

**PHYSICOCHEMICAL PROPERTIES**
Physicochemical Properties of Dredge Spoil,
W75-11465 5B

**PHYTOPLANKTON**
Phytoplankton in Lake Mascardi (Rio Negro, Argentina), (In Spanish),
W75-11532 5C

Phytoplankton Diversity and Chlorophyll-a in a Polluted Estuary,
W75-11607 5C

Decomposition of Urea Associated with Photosynthesis of Phytoplankton in Coastal Waters,
W75-11612 5C

**PICRAMINE-EPSILON**
Spectrophotometric Determination of Sugars in Natural Waters, (In Russian),
W75-11437 5A

**PIKES**
Mercury Levels in Fish in the La Grande River Area, Northern Quebec,
W75-11756 5A

**PILOT PLANTS**
The Physico-Chemical Treatment of Crude Sewage,
W75-11404 5D

Breakthrough in Sewage Treatment--Cash, Land, and Energy Saved.
W75-11413 5D

Suspended Solids Removal Processes Studied at Metro Chicago,
W75-11741 5D

**PIPE FLOW**
Water Hammer in Coaxial Pipe Systems,
W75-11460 8B

Cavitation in Butterfly Valves,
W75-11777 8B

Energy Losses at 90 Degrees Pipe Junctions,
W75-11778 8B

**PIPELINE DREDGE SPOILS**
Disposal of Sandy Pipeline Dredge Spoils by End Dumping,
W75-11566 5G

**PIPELINES**
Large Diameter Submarine Steel Pipeline Crossings,
W75-11380 8A

Sewer Branch Saddle Connector,
W75-11677 8C

Sewer Line Blow-Out Plug,
W75-11684 8C

Balancing Reservoir--A Key Element in Water Supply Plan,
W75-11687 4A

**PIPES**
Large Diameter Submarine Steel Pipeline Crossings,
W75-11380 8A

Apparatus for Sewer Treatment to Kill Three Roots and Other Organic Growth Therewithin.
W75-11513 5G

Sewer Line Blow-Out Plug,
W75-11684 8C

**PIPING SYSTEMS**
Pipe Insertion Renews Sewers with Little Excavation.
W75-11620 5D

**PLANNING**
Hydrology for Land-Use Planning: The Hillside Area, Anchorage, Alaska,
W75-11504 4A

Advanced Wastewater Treatment Plant with Designed-In Reliability,
W75-11700 5D

Land Use and Environmental Planning: An Application in the South Carolina Coastal Zone,
W75-11766 6G

Water Resources Planning in Urban Areas.
W75-11769 5D

Development Planning of Laguna de Bay--Philippines,
W75-11770 4A

Flood Plain Information: Plum Creek, Brunswick Hills and Medina Townships, Medina County, Ohio.
W75-11788 4A

Forecasting Urban Water Use: Commercial Establishments,
W75-11795 6D

Water Development in Management of Livestock and Wildlife on Mountain Wildlands,
W75-11804 3B

**PLANT GROWTH**
Establishing Windbreaks in Semiarid Areas by Altering the Microclimate or Supplying Additional Water,
W75-11827 3B

Effect of Preplant-Only Irrigation on Cotton Yields,
W75-11842 3F

**PLANT PHYSIOLOGY**
Contribution to the Ecology of Indian Aquatics: IV. Rate of Dry Matter Production of the Leaves of Several Common Aquatic Plants of Gorakhpur (India),
W75-11386 2I

A Water Potential Threshold for the Increase of Abscisic Acid in Leaves,
W75-11394 2I

**PLASTIC PIPES**
Mile of Sewer Line Renewed with Plastic Piping.
W75-11619 5D

**PLASTICS**
Treating Effluent.
W75-11444 5D

Using Paraffin and Polythylene to Harvest Water for Growing Shrubs,
W75-11821 3B

**PLATING WASTES**
Plating and Cyanide Wastes (Literature Review),
W75-11545 5D

**PLUM CREEK (OHIO)**
Flood Plain Information: Plum Creek, Brunswick Hills and Medina Townships, Medina County, Ohio.
W75-11788 4A

**PLUMES**
Submerged Buoyant Jets in Quiescent Fluids,
W75-11461 8B

**PLUNGING FLOW**
Analysis of Plunging Phenomena in Water Reservoirs,
W75-11655 4A

**PODS (PEANUTS)**
Effects of Soil Temperature and Soil Moisture in Podding Zone on Pod Development of Peanut Plants, (In Japanese),
W75-11456 3F

**POISONS**
Ultrastructural Effects of Acute Tetraethyllead Poisoning on Nerve Cells of the Rabbit Brain.
W75-11530 5C

**POLLUTANT IDENTIFCATION**
The Determination of Traces of Lead (II) by Solid-State Luminescence,
W75-11541 5A

**POLLUTANT IDENTIFICATION**
The Crystal and Molecular Structure of Selected Pesticidal Water Pollutants,
W75-11351 5A

An Automated Spectrophotometric Suspended Solids Analysis for Activated Sludge,
W75-11408 5D

Interlaboratory Study of Methods for Chemical Analysis of Water,
W75-11409 5A

The Use of Computers for Forecasting the Sanitary Systems of Water Bodies (Primeneniye EVM dlya prognozirovaniya sanitarnogo sostoyaniya vodoyemov),
W75-11410 5D

Spectrophotometric Determination of Fluorine in Water, (In Russian).
W75-11433 5A

Apparatus for Providing a Statistical Count of Particulate Material in a Fluid,
W75-11434 5A

Is the Malachite Green Broth According to Habs and Kirchner Suitable for Serving as an Isolation Medium for Pseudomonas Aeruginosa from Water, (In German),
W75-11435 5B

Spectrophotometric Determination of Sugars in Natural Waters, (In Russian),
W75-11437 5A

Biliary Excretion of Phenyl and Methyl Mercury Chlorides and Their Enterohepatic Circulation in Rats,
W75-11525 5C

Radioactive - Tracer Displacement Method for the Determination of Small Quantities of Nickel,
W75-11526 5A

Chemical Composition of Aegean Sea Sediments,
W75-11533 2J

The Occurrence of Mercury in Amphibia,
W75-11534 5A

Atomic-Absorption Spectrometric Determination of Cadmium, Lead, and Zinc in Salts or Salt Solutions by Hanging Mercury Drop Electrodeposition and Atomization in a Graphite Furnace,
W75-11536 5A

A Comparative Study on Methods for Cadmium Analysis of Grain with an Application to Pollution Evaluation,
W75-11539 5A

Catalytic-Coulometric Determination of Copper at Microgram and Nanogram Levels,
W75-11540 5A

Loss of Trace Elements from Natural Water During Storage. I. Behavior of 203 Hg and 65 Zn Added to Pond Water,
W75-11543 5A

Lead and Arsenic Levels of Dairy Cattle in Proximity to a Copper Smelter,
W75-11544 5A

Plating and Cyanide Wastes (Literature Review),
W75-11545 5D

Submicrogram Per Gram Concentrations of Mercury in Orchard Leaves Determined by Isotope Dilution and Spark-Source Mass Spectrometry,
W75-11581 5A

The Estimation of the Amount of Empire Mix Crude Oil in Mullet, Shrimp, and Oysters by Liquid Chromatography,
W75-11613 5A

Pollution Detection and River Quality Management,
W75-11753 5A

Mercury Levels in Fish in the La Grande River Area, Northern Quebec,
W75-11756 5A

The Brown Pelican and Certain Environmental Pollutants in Louisiana,
W75-11757 5A

Methods of Detecting the Fluorine Ion in Air and Water, (In Russian),
W75-11794 5A

The Behaviour of Metal Tetramethylenedithiocarbamates in the Graphite-Tube Furnace for Atomic Absorption Spectrometry,
W75-11797 5A

The Determination of Cadmium in Sea Water by Radioactivation,
W75-11798 5A

**POLLUTION ABATEMENT**

On Taxation and Firms Choice of Waste Water Treatment Technology,
W75-11767 5G

**POLLUTION TAXES (CHARGES)**

An Equitable Sewer Use Charge System,
W75-11391 5G

Sufficient Water Supply and Sewer System, and Equitable Distribution of the Costs (Tillstrekkelige vann- og Kolakkanlegg-samt rettferdig fordeling av kostnadene),
W75-11393 5D

On Taxation and Firms Choice of Waste Water Treatment Technology,
W75-11767 5G

**POLYCHLORINATED BIPHENYLS**

The Brown Pelican and Certain Environmental Pollutants in Louisiana,
W75-11757 5A

**PONDEROSA PINE TREES**

Diurnal Patterns of Water Potential in Abies Concolor and Pinus Ponderosa,
W75-11382 2I

**POPULATIONS**

Habitat Heterogeneity and Avian Community Structure in North American Grasslands,
W75-11425 2I

**POROUS MEDIA**

Simulation of Miscible Displacement in Soils,
W75-11590 2F

Axisymmetric Seepage Flow Through Semi-Infinite Porous Media,
W75-11633 2F

**POSIDONIA**

The Growth of Posidonia and the Urban Pollution in the Gulf of Giens, (In French),
W75-11761 5C

**POTABLE WATER**

Sanitary and Hygienic Evaluation of Seepage Waters of Structures Protecting Reservoirs (In Russian),
W75-11412 5B

**POTOMAC RIVER**

Geohydrologic Reconnaissance of the Upper Potomac River Basin,
W75-11493 2F

**POWER-LAW FLUIDS**

Turbulent Flow of Power-Law Fluids,
W75-11651 8B

**PRE-IMPOUNDMENT**

Predictive Modeling of Effects of the Planned Kindred Lake on Ground-Water Levels and Discharge, Southeastern North Dakota,
W75-11503 4A

**PRE-TREATMENT**

Combined Treatment of Municipal and Industrial Wastewater,
W75-11733 5D

**PRECIPITATION GAGES**

The Rainfall Recorder Problem,
W75-11448 2B

Comparison of Precipitation Gage Catches with a Modified Alter and a Rigid Alter Type Windshield,
W75-11457 2B

**PRESERVATION**

State Regulation of Coastal Water Area Preserves,
W75-11568 6E

**PRESSURE SEWERS**

Environmental Constraints Challenge Designers of Shoreline Community Near Kansas City, Missouri,
W75-11392 5D

**PRESTON TUBE**

Boundary Shear in Channel with Flood Plain,
W75-11463 8B

**PROGRAMS**

Cooperation in Water Resources Programs: Alaska's Example,
W75-11775 6B

**PROJECT BENEFITS**

Urban Drainage and Flood Control Projects Economic, Legal and Financial Aspects
W75-11352 6B

**PSEUDOMONAS**

Is the Malachite Green Broth According to Habs and Kirchner Suitable for Serving as an Isolation Medium for Pseudomonas Aeruginosa from Water, (In German),
W75-11435 5B

**PSEUDOMONAS-AERUGINOSA**

Is the Malachite Green Broth According to Habs and Kirchner Suitable for Serving as an Isolation Medium for Pseudomonas Aeruginosa from Water, (In German),
W75-11435 5B

**PUERTO RICO COAST**

Storm Tide Frequency Analysis for the Coast of Puerto Rico,
W75-11561 2A

**PUGET SOUND (WA)**

Coastal Resource Use: Decisions on Puget Sound,
W75-11573 6B

**PUGET SOUND (WASH)**

Lead and Arsenic Levels of Dairy Cattle in Proximity to a Copper Smelter,
W75-11544 5A

**PULP AND PAPER INDUSTRY**

Sequential Treatment of Kraft Pulp Washing Wastewater by Pilot Plant-Activated Sludge Treatment, Lime Treatment and Activated Carbon Treatment, (In Japanese),
W75-11362 5D

Float-Wash Fractionator Saves Fibre and Water at Grand'Mere,
W75-11363 5D

New Effluent Treatment Plant Opened at Bristol for Board Mills.
W75-11364 5D

Studies on Recovery of Chemicals and Manufacture of Activated Substances from Pulping Waste Liquor, Part 2, Use of Softwood KP-Waste Liquor, (In Japanese),
W75-11373 5D

**PULP WASTES**

Fish Toxicants in Kraft Effluents,
W75-11358 5C

Distribution of Lignin in the Waters of Lourizan Inlet, as a Measurement of Contamination Due to Dumping of Ligninsulfonic Lyes, Resulting from Production of Cellulose Pulp, (In Spanish),
W75-11678 5B

**PULSE IRRIGATION**

Basic Principles of Pulse Irrigation,
W75-11833 3F

**PUMPING**

Determining Optimal Well Discharge,
W75-11768 4B

**PUMPING PLANTS**

Dimensioning and Design of Small Waste Water Pumping Stations (Bemessung und Gestaltung von Klein-Abwasserpumpwerken),
W75-11744 8C

PUMPS
Environmental Constraints Challenge Designers of Shoreline Community Near Kansas City, Missouri,
W75-11392 5D

Centrifugal Pump for Processing Liquids Containing Abrasive Constitutents, More Particularly, a Sand Pump of a Wastewater Pumper,
W75-11679 5D

Dimensioning and Design of Small Waste Water Pumping Stations (Bemessung und Gestaltung von Klein-Abwasserpumpwerken),
W75-11744 8C

QUANTITATIVE INORGANIC ANALYSIS
Quantitative Inorganic Analysis by Gas Chromatrography, a Review,
W75-11528 5A

RADAR
The Rainfall Recorder Problem,
W75-11448 2B

Cellular Snow Generation--A Doppler Radar Study,
W75-11634 2B

RADIOACTIVE DATING
Sedimentation Rates in a Long Island Marsh Determined by PB210 Dating,
W75-11643 2L

RADIOACTIVITY
Uptake, Distribution and Fate of 203 Hg-Ethylmercuric Chloride in the Guppy and the Coontail,
W75-11529 5C

RADISHES
Different Soil Treatments for Harvesting Water for Radish Production in the Mexico Valley,
W75-11829 3B

RAIN GAGES
The Rainfall Recorder Problem,
W75-11448 2B

RAIN RECORDERS
The Rainfall Recorder Problem,

# CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

**Supported by the Environmental Protection Agency in cooperation with WRSIC**

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

# SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
JAN 9 1976
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 8, NUMBER 24
DECEMBER 15, 1975

W75-11851 -- W75-12400
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents announced in this journal may be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

# SELECTED
# WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

**VOLUME 8, NUMBER 24**
DECEMBER 15, 1975

W75-11851 -- W75-12400

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

## CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

**06** WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

**07** RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

**08** ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

**09** MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

**10** SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

**SYSTEMS APPROACH TO HYDROLOGY.**
Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, 1971. 464 p.

Descriptors: *Conferences, *Hydrology, *Systems analysis, *Hydrologic systems, *Statistical models, *Hawaii, Input-output analysis, Simulation analysis, Stochastic processes, Streamflow, Mathematical models, Synthetic hydrology, Runoff, Floods, Flood flow, Rainfall-runoff relationships, Precipitation(Atmospheric), Evapotranspiration, Groundwater, Network design, Regional analysis, Water yield, Water quality control, Watersheds(Basins), Streams erosion, Scour.
Identifiers: *Japan, Kinematic wave.

The seminar theme was 'The Systems Approach to Analysis of Hydrologic Processes and Environments.' Twenty papers, nine from Japan and eleven from the United States, were presented. At the end of each paper are summaries of discussion remarks and authors' responses. Titles of papers are: Stochastic Hydrologic Systems; Transformation System in Flood Runoff Phenomena; The Structure of Inputs and Outputs of Hydrologic Systems; A Study of Long Range Runoff System Response Based on Information Theory; Nonlinear Runoff Kernels of Hydrologic System; Linear Systems Analysis in Hydrology--The Transform Approach, The Kernel Oscillations and the Effect of Noise; Effect of an Error in Discharge Measurements on the Detection Process in Runoff Systems Analysis; Kernels of Stochastic Linear Hydrologic Systems; Hydrologic Systems in Hawaii; The Stochastic Kinematic Wave; Systems Simulation of Streamflows; Efficiency of Parameter and Sate Estimation Methods in Relation to Models of Lumped and Distributed Hydrologic Systems; Effects of Movement of Precipitation Area upon Runoff Phenomena; Numerical Simulation of Watershed Hydrology; An Application of Simulated Rainfall Models to Forecasting of the Long Term Variation of River Bed; Simulation of the Short-Time Scour-Fill Process in Erodible Streams with Stochastic Sediment Transfer at the Stream Bed; Meteoro-Hydrological Aspects of Rainfall in Japan; The Role of Network Design in the Management and Control of Streamflow Water Quality; A Three-Component, Nonlinear Water-Yield Model; and Hydrological Studies of Evapotranspiration and Groundwater Flow in Sandy Land. **STOCHASTIC HYDROLOGIC SYSTEMS,**
Illinois Univ., Urbana, Dept. of Hydraulic Engineering.
V. T. Chow.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 1-23, 1971. 4 fig, 3 tab, 10 ref. OWRT A-029-ILL(6) 14-01-0001-1632.

Descriptors: *Hydrologic systems, *Stochastic processes, *Annual flood, *Time series analysis, *Water yield, Mathematical models, Evapotranspiration, Runoff, Rainfall, Analytical techniques, Model studies, Watersheds(Basins), Markov processes, Rainfall-runoff relationships, Precipitation(Atmospheric), Water storage.
Identifiers: *French Broad River(NC), *Sangamon River(Ill), Basin storage, Power spectrum analysis.

Hydrologic phenomena were simulated as stochastic hydrologic systems in terms of mathematical models whose components are represented by stochastic processes. The proposed stochastic hydrologic model was based on a mathematical formulation of the principle of system continuity composed of component stochastic processes of precipitation, runoff, and evapotranspiration, plus losses and basin storage. Based on various assumptions two stochastic watershed system models were formulated and analyzed to illustrate the application of the proposed stochastic hydrologic model. One watershed system model was the annual storm-flood model in which the input hourly rainfall of the annual storm was represented by a first-order nonhomogeneous Markov chain and the annual storm-flood by multiple linear regression. The rainfall and runoff relationship of the watershed was represented by a bivariate Markov process. The other watershed model was the watershed yield model in which the component hydrologic processes of precipitation, runoff, evapotranspiration, and basin storage were simulated as stochastic processes by time series to be determined by correlogram and power spectrum analysis. As numerical examples for analysis, the French Broad River basin above Bent Creek, North Carolina, was used as the watershed for the annual storm-flood model, and the upper Sangamon River basin above Monticello in east central Illinois was used as the watershed for the watershed yield model. **THE STRUCTURE OF INPUTS AND OUTPUTS OF HYDROLOGIC SYSTEMS,**
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 51-79, 1971. 12 fig, 3 ref. NSF GK-11444.

Descriptors: *Hydrologic systems, *Mathematical models, *Input-output analysis, *Model studies, *Systems analysis, Mathematical studies, Hydrology, Analytical techniques, Theoretical analysis, Equations, Stochastic processes, Correlation analysis, Time series analysis, Statistical methods, Rainfall, Streamflow, Probability, Hydrologic aspects.

A brief analysis leads to the conclusion that all water inputs and outputs of hydrologic environments are periodic-stochastic processes. To make a basic structural analysis of hydrologic processes possible, ten hypotheses were given. Complex hydrologic processes of inputs and outputs, such as river flow and precipitation time series, are composed of periodic components in several parameters and an independent stochastic component. Periodicities in the mean and standard deviation may or may not be proportional. Techniques for making inferences about significant harmonics were outlined for both cases. Nonparametric and parametric methods of removing these periodicities from a series were given and the autocorrelation coefficients of standardized series were shown to be periodic also. To obtain the independent stochastic components of the second-order stationarity, periodicities in the mean, standard deviation, and autocorrelation coefficients can be removed. Complex hydrologic series are not third-order stationary either. The shapes of distributions of stochastic independent components for discrete series of small time units (say one day) require the fitting of probability density functions of an unfamiliar type to hydrology. **A STUDY OF LONG RANGE RUNOFF SYSTEM RESPONSE BASED ON INFORMATION THEORY,**
Kyoto Univ., (Japan). Dept. of Civil Engineering.
T. Ishihara, and S. Ikebuchi.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 80-101, 1971. 12 fig, 4 tab, 15 ref.

Descriptors: *Rainfall-runoff relationships, *Stochastic processes, *Hydrologic systems, *Statistical methods, Correlation analysis, Hydrology, Mathematical studies, Systems analysis, Analytical techniques, Runoff, Unit hydrographs, Synthesis, Precipitation(Atmospheric), Rainfall, Snowmelt, Dishcharge(Water), River flow, Base flow.
Identifiers: *Information theory.

Long-range runoff phenomena are essentially stochastic processes. To understand them, their deterministic characteristics and the statistical laws involved in the system of transition between precipitation and river discharge must be known. Methods were proposed for the analysis and synthesis of a long-range runoff response based on the ideas and techniques of information theory. First, statistical properties of daily precipitation and river discharge series were discussed through their correlation analysis; then, after time-invariant linearization of the runoff system according to the physical mechanisms in the runoff phenomena, the unit-impulse response function designated as the 'statistical unit hydrograph' was derived from the Wiener-Hoph equation. Statistical unit hydrographs that take into account both the variations of the water content in the subsurface stratum during the rainy season and the daily snow melt water input to the system in the snow melt season were proposed. Results of these procedures applied to the Yura River basin were in good agreement with the natural stream records. (See also W75-12014) (Humphreys - ISWS)

**NONLINEAR RUNOFF KERNELS OF HYDROLOGIC SYSTEM,**
Tokyo Inst. of Tech. (Japan). Dept. of Civil Engineering.
M. Hino, T. Sukigara, and H. Kikkawa.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 102-115, 1971. 6 fig, 17 ref, 1 append.

Descriptors: *Hydrologic systems, *Stochastic processes, *Inputioutput analysis, *Runoff, Runoff forecasting, Floods, Theoretical analysis, Mathematical studies, Statistical methods, Hydrograph analysis, Precipitation excess, Correlation analysis, Hydrology, Rainfall.
Identifiers: Nonlinear stochastic processes, Nonlinear runoff kernels.

In recent years, great strides have been made in the area of stochastic hydrology. A lot of quantitative information on hydrologic phenomena has been derived reasonably from statistical hydrologic data. However, studies from a point of view of non-linear stochastic process are rather few and not necessarily successful. A method was described of deriving the nonliner 'runoff kernels' based on the Wiener theory of nonlinear random process, together with comments on the results obtained from applying method to a daily rainfall-runoff process for a real basin. It was shown that the short-period runoff component shows strong nonlinearity at a short lag-time, while a weak nonlinearity was also found for the long term runoff component. The predictability for heavy daily rainfall was shown to be increased considerably. In an appendix, the importance of the probability distribution of rainfall and runoff data was discussed, stressing that the preliminary processing to transform these data into random variables with Gaussian probability distribution will further improve the efficiency of linear or nonlinear stochastic hydrologic theories. W75-12019

**EFFECT OF AN ERROR IN DISCHARGE MEASUREMENTS ON THE DETECTION PROCESS IN RUNOFF SYSTEMS ANALYSIS,**
Hokkaido Univ., Sapporo (Japan). Dept. of Civil Engineering.
T. Kishi.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 143-162, 1971. 9 fig, 3 ref.

Descriptors: *Runoff, *Systems analysis, *Mathematical studies, *Theoretical analysis, Discharge(Water), Velocity, Measurement, Reliability, Flow measurement, Methodology, Reservoirs, Turbulence, Flow characteristics, Rainfall.
Identifiers: *Error, Observation error, Truncation error.

A river basin acts as a low pass filter in the prediction process and becomes an amplifier for high frequency bands in the detection process. Theoretical considerations were made about the detection process for a basin of cascade-connected linear reservoirs. Theoretically, the possibility of obtaining the time function of input depends on the functional form of the output and on the order of the system or the number of linear reservoirs. An approximate method of calculation by which the Fourier inverse transform of the detected input function is always integrable was presented. Results of calculations using field data were described as illustrative examples. It was pointed out that the precision of the detected values of the input decreases markedly if even a small error is contained in the measurements of the output. Also investigated was the relation of turbulence characteristics of natural streams to the error in velocity measurements which must be a significant factor affecting the total error in discharge measurements. The error in velocity measurements can be decreased appreciably if the observational period at a point is prolonged by a small fraction of time. (See also W75-12014) (Humphreys - ISWS)

**KERNELS OF STOCHASTIC LINEAR HYDROLOGIC SYSTEMS,**
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
R. G. Quimpo.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 163-185, 1971. 4 fig, 20 ref. NSF GK-20388.

Descriptors: *Hydrologic systems, *Stochastic processes, *Runoff, *Mathematical models, Mathematical studies, Analytical techniques, Model studies, Input-output analysis, Systems analysis, Hydrology, Synthetic hydrology, Simulation analysis, Markov processes.
Identifiers: Linear stochastic processes, Autoregression model.

Using operational methods of analyzing linear systems, kernels corresponding to current stochastic models of hydrologic time series were obtained. It was shown that these models essentially assume the form of the kernel of the linear system in terms of undetermined parameters as contrasted with the approach which requires the solution of the Wiener-Hopf equations. Markov second and third order autoregressive models equivalent to two types of self-similar models for a typical river were obtained using a least-square criterion on the kernel. To compare the re-scale range properties of synthetic data using different generating techniques, 2400 years of record were synthesized for each of five models. Visual inspection of respective re-scaled-range vs. length-of-record plots suggested essentially the same result for the range regardless of which model was used to generate data. **HYDROLOGIC SYSTEMS IN HAWAII,**
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
P. C. Ekern, L. S. Lau, F. L. Peterson, S. Price, and R. Pulfrey.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 186-201, 1971. 6 fig.

Descriptors: *Hydrologic systems, *Rainfall, *Groundwater, *Hawaii, Geologic history, Geology, Climates, Evaporation, Solar radiation, Floods, Hydrology, Islands, Volcanoes, Transpiration.

Geologic history, rainfall climate, evaporation and transpiration, flood hydrology, and geology and groundwater under Hawaiian conditions were each briefly presented. The Hawaiian islands are a chain of shield-shaped basaltic domes built over a 1600 mile fissure of the ocean floor which has existed probably since at least Middle Tertiary (about 30 million years). The major climatic controls in Hawaii are exercised by the tropical locale, the surrounding ocean, and the Pacific anticyclone and topography. Each of the major islands has its distinctive terrain, but their mean rainfall distributions have certain features in common. Great variations of rainfall occur within small distances and with elevation. In some areas, mean annual rainfall increases by 75 inches for each 1000 feet of elevation and 2 or 3 miles of distance. On all the major islands, localities with over 300 inches of rain a year and others with less than 20 inches a year may be 20 miles or less apart. Hawaii's most serious hydrologic problem, other than long-range water resources management and planning, is flash flooding. Two general modes of groundwater occurrence are present in the Hawaiian islands: high-level groundwater and basal groundwater. Dikes in and near the rift zones of the volcanoes impound large volumes of fresh water. The principal source of fresh groundwater in the Hawaiian islands is the lens-shaped basal water body, commonly called the Ghyben-Herzberg lens, floating on denser salt water. **THE STOCHASTIC KINEMATIC WAVE,**
Massachusetts Inst of Tech., Cambridge. Dept of Civil Engineering.
P. S. Eagleson.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 202-225, 1971. 7 fig, 1 tab, 14 ref.

Descriptors: *Hydrologic systems, *Stochastic processes, *Hydrographs, Streamflow forecasting, Mathematical models, Rainfall-runoff relationships, Streamflow, Runoff, Overland flow, Watersheds(Basin), Storm runoff, Runoff forecasting, Peak discharge, Annual, Flood frequency, Rainfall, Precipitation excess.
Identifiers: *Kinematic wave.

The kinematic wave method of hydrograph forecasting was generalized through the incorporation of random variations in the temporal and areal distribution of storm rainfall excess. Expressions were derived for the peak direct runoff and streamflow in terms of the statistics of these random variables. Generalized probability density functions of storm duration and storm rainfall depth (given duration, an assumed loss function, and an assumed probability density function) for a runoff-producing area were used with the stochastic equations for maximum direct storm runoff to derive the probability density function of peak streamflow. The latter was used to obtain the classical flood-frequency curve as an explicit function of parameters defining the rainfall distributions and the catchment-stream phsiography. The flood-frequency relation was used to derive the mean annual flood as a function of catchment area and this compared well with observations from 44 Connecticut rivers. Agreement of the predicted flood-frequency curve with observation on particular catchments was also good but was apparently sensitive to the particular value of the direct runoff fraction and to the fraction of the catchment area contributing direct runoff. **EFFICIENCY OF PARAMETER AND STATE ESTIMATION METHODS IN RELATION TO MODELS OF LUMPED AND DISTRIBUTED HYDROLOGIC SYSTEMS,**
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
C. C. Kisiel.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 246-278, 1971. 67 ref. OWRT B-007-ARIZ(14)

Descriptors: *Hydrologic systems, *Systems analysis, *Model studies, *Decision making, *Reviews, Hydrology, Optimization, Theoretical analysis, Efficiences, Stochastic processes, Statistical methods, Input-output analysis, Risks, Calibrations, Time series analysis.
Identifiers: Bayesian decision theory, Model validation.

A review of the important philosophical and practical issues inherent in modeling and parameter estimation errors was given. Included was a discussion of the identification problem and its relation to optimization theory and statistical estimation theory. System determinacy and indeter

ninacy was defined in terms of the number of variables, data points, and equations and then urther elaborated in terms of design, identification, and parameter estimation problems. In view f the proliferation of hydrologic models and an pparent polarization of viewpoints on modeling, ome issues involved in choosing among models vere presented. These include model validation, pparent and inherent randomness, and lumped nd distributed parameter models. The latter nodels were interpreted by a frequency domain nethod; a heat flow problem was modeled by both nethods and interpreted in terms of autocorrelaion and spectrum functions for the lumped model. Objective and subjective criteria were presented or validation of hydrologic models. An outline of Bayesian decision theory was presented and then pplied to evaluating the cost of uncertainty in the esign of bridge piers. The uncertainty exists in he mean and variance of the log-normal distribuion used to describe the annual peak flows on Rilto Creek in Tucson, Arizona. A model for valuating the worth of additional hydrologic data vas also presented. (See also W75-12014) (Humphreys - ISWS)

**EFFECTS OF MOVEMENT OF PRECIPITATION AREA UPON RUNOFF PHENOMENA,**
Tokyo Univ., (Japan). Dept. of Civil Engineering.
Y. Takahasi, K. Mushiake, and T. Hashimoto.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 279-294, 1971. 12 fig, 5 ref.

Descriptors: *Hydrographs, *Hydrologic systems, *Model studies, *Runoff, Mathematical models, Watersheds(Basins), Storm runoff, Storms, Movement, Velocity, Rainfall, Spatial distribution, Precipitation(Atmospheric).
Identifiers: *Japan, *Kanna River.

Model simulation of streamflow hydrographs usually assumes that rainfall is distributed uniformly over the watershed. But, in reality, rainfall may vary considerably in time and in space. For floods in small river basins (less than several hundred square kilometers) in Japan, effects of the spatial distribution and movement of precipitation storm cells especially cannot be ignored. The effects of the distribution of precipitation and its movement upon storm hydrographs were reported. The use of a hydraulic runoff model was applied as the method of runoff analysis. The model was solved numerically. Studies about effects of the various characteristics of storm area upon flood hydrographs were carried out by means of numerical experiments on two kinds of simplified catchment model. At the same time, several properties of the model catchment were studied. Characteristics of rain storms, such as scale, distribution, direction, and velocity, were investigated through analyses of hydrological data in the Kanna River Basin. Comparisons between computed and observed hydrographs caused by a storm passing over the basin showed good agreement for the peak flow and the rising limb of the hydrograph, but agreement was not good for recession limb. **NUMERICAL SIMULATION OF WATERSHED HYDROLOGY,**
Texas Univ., at Austin. Dept. of Civil Engineering.
W. L. Moore, and B. J. Claborn.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 295-325, 1971. 12 fig, 5 tab, 11 ref.

Descriptors: *Rainfall-runoff relationships, *Simulation analysis, *Synthetic hydrology, Stochastic processes, Watersheds(Basins), Water storage, Soil moisture, Mathematical models, Streamflow, Soil water movement, Rainfall, Infiltration, Runoff, Computer programs.
Identifiers: *Stanford Watershed Model, Fortran IV.

In translating the Stanford Watershed Model into Fortran IV, several modifications were made in the manner of treating depression storage, infiltration, soil moisture storage, and soil moisture movement. The result was a program variation for simulating the physical processes occuring in a watershed. The rainfall input was stored and transferred to various elements using mathematical relations based on physical processes. Most parameters have physical interpretation and with experience can be estimated with at least some degree of precision. The simulation emphasized surface storage, infiltration, and soil moisture phases as significant in determining the amount of streamflow. The time distribution of runoff was treated by means of a distribution graph. Limited results were included for application to two watersheds. (See also W75-12014) (Jess - ISWS)

**A THREE-COMPONENT, NONLINEAR WATER-YIELD MODEL,**
Agricultural Research Service, Athens, Ga. Southeast Watershed Research Center.
W. M. Snyder, W. C. Mills, and J. C. Stephens.
In: Systems Approach to Hydrology; Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 428-443, 1971. 8 fig, 2 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Simulation analysis, *Synthetic hydrology, Stochastic processes, Mathematical models, Streamflow, Water yield, Runoff, Rainfall, Watersheds(Basins), Discharge(Water).
Identifiers: *Rainfall-runoff models.

A three-component, nonlinear model was developed and tested on three experimental watersheds. Input data were rainfall in 5-day periods. The first component expressed physical characteristics of the watershed in terms of a potential for water yield. The second varied with watershed wetness and related transmission of potential yield to the watershed outlet. The final component was a seasonal-loss function. Input rainfall was diminished by this function to produce 5-day amounts of rainfall. Output was volume of streamflow for synchronous 5-day periods. (See also W75-12014) (Jess-ISWS)

State Univ. of New York, Buffalo. Dept. of Civil Engineering.
D. D. Meredith.
Water Resources Bulletin, Vol 11, No 3, p 526-535, June 1975. 5 tab, 6 ref, append. OWRT B-062-ILL(4). 14-31-0001-3580.

Descriptors: *Great Lakes, *Simulation analysis, *Hydrology, *Model studies, Hydrologic data, Precipitation(Atmospheric), Evaporation, Runoff, Water balance, Regression analysis, Water temperature, Statistical models, Lakes, Statistics.
Identifiers: Theisson polygon method.

A study was undertaken to develop predictive models for Great Lakes hydrology which could be used in simulation studies to investigate alternative operating rules. The individual hydrologic components were assumed to be normally distributed for each month, and linear regression equations were estimated for predicting the value of the individual monthly hydrologic components. It was shown that some of the hydrologic components for downwind (in this case, downstream) lakes were dependent on hydrologic events for the upwind lakes. This was particularly so for precipitation in the downwind lake basins which appeared to be dependent on evaporation values for upwind lakes. Therefore, any change in the hydrology of an upwind lake would cause a change in the hydrology of the downwind lakes. (Roberts-ISWS)

## 2B. Precipitation

**THE STOCHASTIC AND CHRONOLOGIC STRUCTURE OF RAINFALL SEQUENCES - APPLICATION TO INDIANA,**
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
M. L. Kavvas, and J. W. Delleur.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 257, $7.25 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center Technical Report No. 57, 1975. 199 p, 62 fig, 32 tab, 83 ref, 3 append. OWRT B-036-IND (10).

Descriptors: *Rainfall, Stochastic Processes, *Indiana, Precipitation, Central U.S., Statistical Methods.
Identifiers: *Rainfall, *Sequences, *Rainfall Occurrences, Rainfall Counts, Neyman-Scott Cluster Process, Autoregressive Moving Average Model.

The report is in two parts: the first is concerned with the point stochastic analysis of the daily rainfall occurrence in Indiana, and the second with the time series analysis of the monthly and the annual rainfall sequences at various stations in Central United States. The point statistical analysis utilized some statistical functions and tests of hypotheses. There are cyclicities both in the first and second moments of the point stochastic process. Physically meaningful annual and 15-day cycles were found to be significant. There is a slight downward trend in the rate of daily occurrence in Indiana. The Neyman-Scott cluster process was constructed in the time dimension to model this physical persistence. The model fit the data well. In the time series analysis, a theoretical and empirical analysis of the removal of cyclicities was performed; however differencing could not be used for the generation purposes although it did

remove the cyclicities in the data. Standardization, although it introduces some spurious nonstationarities into the data, is an acceptable method for generation purposes. A spectral and a variance-time analysis of the ARIMA family of the hydrologic time series models was done to study their long range dependence characteristics. For the annual rainfall series a white noise model with normally distributed residuals is adequate and can be used for hydrologic simulation purposes in the Central United States.

**DISTRIBUTION OF AQUATIC MACROPHYTES RELATED TO PAPER MILL EFFLUENTS IN A SOUTHERN MICHIGAN STREAM,**
Southeast Missouri State Univ., Cape Girardeau. Dept. of Biology.
R. G. Kullberg.
American Midland Naturalist, Vol 91, No 2, p 271-281, 1974. 3 fig, 3 tab, 18 ref.

Descriptors: *Aquatic plants, *Distribution, *Streams, *Michigan, Volume, Standing crops, Turbidity, Chemical properties, Pollution abatement, Pulp wastes, Ammonia, Sulfates, Lignins, Speciation, Peat.
Identifiers: *Portage Creek(Michigan), Tannins, Nasturtium officinale, Potamogeton pectinatus, Potamogeton crispus, Sparganium americanum, Elodea canadensis, Plant cover.

Distribution of macrophyte cover, volume, and standing crop along Portage Creek near Kalamazoo, Michigan, were estimated. The stream begins in an unpopulated, uncultivated area and flows into an urban area where it received paper mill wastes, after which aquatic macrophytes were absent. Another study made one year after cessation of paper mill effluents showed a ten-fold reduction in turbidity in the polluted portion of the stream, suggesting that turbidity was the most probable cause for the earlier absence of macrophytes. Concentration of dissolved substances was low and relatively stable in the upper reaches. Ammonia, sulfate, and tannin-lignin concentrations increased in the lower reaches. Down-stream the only cover was by Nasturtium officinale. The substrate cover by macrophytes was 41% in the upstream unpolluted portion. The two dominant species were Potamogeton pectinatus and Sparganium americanum. Aquatic macrophytes occupied 0.043% of the water volume. Of the ten species found, Nasturtium officinale, Potamogeton crispus, P. pectinatus, and Elodea canadensis occupied 82.8% of total plant volume and comprised 83.3% of dry weight. Length of growing season, mean annual temperature, concentration of dissolved substances, and shallow water were responsible for the low standing crop and number of species. Descriptors: *Climatic zones, *Rainfall intensity, *Foreign countries, *Frequency curves, Rainfall, Geographical regions, Rainfall disposition, Distribution patterns, Diurnal, Precipitation excess, Topography, Climatology, Climatic data, Orography, Cloud bursts, Duration curves, Frequency, Rates, Depth, Areal, Monsoons, Typhoons.
Identifiers: *Japan.

The distribution of the regional division of heavy rainfalls in Japan and its meteorological causes were briefly described. Those distributions coincided very well with that of the climatic provinces. Based on the results of climatological studies in Japan, it was suggested that the climatic province is available for estimation of the various hydrological values as follows: (1)the characteristics of depth-duration and intensity-duration curve, (2)regional change of rainfall amount and its intensity, and (3)recurrence interval of rainfall amount. Study results were presented in graphical form. (See also W75-12014) (Humphreys - ISWS)

entifiers: *Radar rainfall measurements.

age and radar methods of convective rain mea-rement were compared in the context of the con-uing multiple cloud seeding experiment of the xperimental Meteorology Laboratory (EML). An ptimal system, combining the best features of th, was recommended. The nature of the Florida nvective rainfall measured was documented ing measurements from a dense raingage esonet (about 3 sq km per gage over 570 sq km) at was operated for a total of 93 days in 1971 and 73. The gaging requirements for detection and easurement of 24 hour rainfalls in the mesonet ere determined using the full complement of ges as the standard. For the measurement of eal convective rainfall greater than 0.25 mm ithin a factor of 2 on 90, 70 and 50% of the days, ge densities of 31, 91 and 208 sq km per gage, spectively, were required. The daily representa-n of rainfall by the radar improves if one adjusts using gages. In the mean, adjustment produced a atistically significant 15% improvement in radar ccuracy. The adjusted radar measurements than ld an approximate gage density equivalence of 25 km per gage. For the measurement of the rain-ll from individual showers anywhere, the gage-djusted radar is far superior to gages alone. For easurement in a fixed area the size of the esonet, gages are superior to radar. To measure infall over the EML target either gages alone, or radar adjusted by gages, can accomplish the sk. **POTENTIAL OF PRECIPITATION MODIFICATION IN MODERATE TO SEVERE DROUGHTS,**
Illinois State Water Survey, Urbana.
F. A. Huff, and R. G. Semonin.
Journal of Applied Meteorology, Vol 14, No 5, p 974-979, August 1975. 2 fig, 5 tab, 9 ref. Bureau of Reclamation 14-06-D-7197.

Descriptors: *Weather modification, *Droughts, *Artificial precipitation, *Illinois, Feasibility, Cloud seeding, Precipitation(Atmospheric), Rainfall, Rainfall disposition, Climatology, Water supply, Mathematical models, Water shortage, Agriculture, Meteorology.
Identifiers: Potential of weather modification.

Assuming that successful precipitation modification could be achieved under atmospheric conditions favorable for the development of natural precipitation, a three-phase study was made to acquire information on the potential for alleviation of moderate to severe droughts in Illinois. The first phase involved time-space analyses of monthly precipitation characteristics in previous major droughts of 12- to 24-month duration. In the second phase, detailed analyses were made of various storm properties during the 1953-54 drought, one of the worst on record in Illinois. The third phase involved use of a one-dimensional cloud model to investigate cloud seeding potential in the 1953-54 drought. Overall, results indicated that atmospheric conditions are favorable for natural precipitation development frequently enough in most droughts that successful cloud seeding operations could contribute occasionally to temporary alleviation of water shortages over portions of an extensive drought region, particularly with respect to agricultural needs. **THE USE OF A MULTIZONE HYDROLOGIC MODEL WITH DISTRIBUTED RAINFALL AND DISTRIBUTED PARAMETERS IN THE NATIONAL WEATHER SERVICE RIVER FORECAST SYSTEM,**
National Weather Service, Slidell, La. Lower Mississippi River Forecast Center.
D. G. Morris.
August 1975. 15 p, 4 fig, 3 tab, 6 ref.

Descriptors: *River forecasting, *Stream flow, *Rain gages, Floods, Rainfall, Hydrology, Rainfall intensity, Precipitation(atmospheric), Hydrography, Forecasting, Weather, Weather data, Precipitation intensity, Rainfall disposition, Parametric hydrology.
Identifiers: *Hydrological models, *Flood forecasting, *Rainfall distribution, *River forecast system, Streamflow simulation, Streamflow hydrologic models, Zonal precipitation, Convective rainfall, Distributed parameters, Parameters, Hydrologic surveys, Meteorological instruments.

Tests were conducted on a basin with a less-than-optimum rain gage network to evaluate the possibility of improving streamflow simulation through the use of zonal precipitation input and zonally varied parameters. Preliminary results for the 959-mi2, 4-zone watershed indicate that improved hydrograph reconstitution is obtained for rises caused by convective rains where the model parameters are adjusted to reflect hydrologic differences between upstream and downstream zones. The multizone approach used is model independent and should be valid for any conceptual hydrologic model employing a unit hydrograph to define the temporal distribution of runoff volumes. (NOAA)

**ESTIMATION OF HURRICANE STORM SURGE IN APALACHICOLA BAY, FLORIDA,**
National Weather Service, Silver Spring, Md.
J. E. Overland.
NOAA Technical Report NWS 17, June 1975. 66p, 23 fig, 1 tab, 25 ref.

Descriptors: *Hurricanes, *Storms, *Storm surge, *Model studies, Tropical cyclones, Climatology, Meteorology, Meteorological data, Storm structure, Weather, Weather patterns, Climatic data, Hydrologic data, Wind velocity, Bays, *Florida.
Identifiers: *Hurrican storm surges, Hurricane storms, *Apalachicola Bay (Fla), Hurricane surges, Hydrodynamic model, Amplitude effects, Space variable wind velocities, Storm parameters, SPLAH computation, Hurricane parameters, Bay models.

A vertically integrated two-dimensional numerical hydrodynamic model is developed for simulation of hurricane surge in Apalachicola Bay. Standard explicit time differencing is used in conjunction with a single Richardson lattice. Model features include finite amplitude effects, space variable wind velocities, and parameterization of flooding of terrain, overtopping of barrier islands and flow through narrow passes. The model utilizes the results of C.P. Jelesnianski's SPLASH model computation for open coast surge as input seaward of the Bay and continues the same storm tract and wind field as used in the SPLASH computation across the Bay. The Bay model was calibrated for the astronomical tides and verified against hurricane Agnes. The response of Apalachicola Bay has been determined from numerical computations for a variety of hypothetical hurricanes as specified by various storm parameters. Surge heights in the Bay increase with hurricane central pressure depression in a nearly linear fashion as does the open coast surge. An important parameter is the duration that the open coast surge remains high, a function of the forward speed of the storm and, to a lesser extent, the radius of the maximum winds. (NOAA)

**A STATISTICAL STUDY OF TROPICAL CYCLONE POSITIONING ERRORS WITH ECONOMIC APPLICATIONS,**
National Hurricane Center, Coral Gables, Fla.
C. J. Neumann.
NOAA Technical Memorandum NWS SR-82, March 1975. 21 p, 7 fig, 6 tab, 24 ref.

Descriptors: *Tropical cyclones, *Hurricanes, *Warning systems, *Monte Carlo method, Storms, Weather data, Weather, Climatology, Meteorology, Meteorological data, Forecasting, Weather forecasting, Coasts, Probability.
Identifiers: *Cyclones, Cyclone studies, Cyclone positioning errors, Hurricane forecasts, Hurricane studies, Hurricane landfall forecasts, Storm landfall, Landfall forecasting, Hurricane warning zone, Coastal regions, Coastal hurricanes, Hurricane warning systems, Hurricane vectors, Control storms, Statistical studies.

Hurricane landfall forecasts are based heavily on the latest available motion vector and position of a storm. Inaccuracies in these data are closely related to errors in the time and place of storm landfall. This study uses a Monte Carlo simulation of hurricane positioning errors to determine a statistical relationship between positioning errors and landfall errors. It is shown that for a typical 18-hour landfall forecast, approximately 22% of the landfall position error can be attributed to initial data uncertainties. It is further shown that a 20% increase in the size of a hurricane warning zone can be expected if the currently observed posion ing errors are increased an average of 10 nmi. However, a 10 nmi decrease in positioning error yields only an 11% decrease in the size of the warning area. An economic analysis of potential changes in the size of hurricane warning areas is also shown. It is estimated that protection costs for a typical 300 nmi Gulf of Mexico coastal hurricane warning zone total $25.1 million. A 10 nmi increase in positioning error will thus increase this loss by about $5 million per storm. A 10 nmi decrease in positioning error will decrease protection costs by about $2.75 million per storm. (NOAA)

**A PRELIMINARY STUDY OF THE FORMATION OF LANDFAST ICE AT BARROW, ALASKA, WINTER 1973-74,**
Alaska Univ., College. Geophysical Inst.
L. H. Shapiro.
June 1975, Report No. UAG R-235 and No. 75-7, 44 p, 14 fig, 2 ref. NOAA Grant No. 04-3-158-41.

Descriptors: *Ice, *Ice cover, *Frozen ground, *Permafrost, *Ice-water interfaces, Mapping, Topographic mapping, Environment, Oceanography, Climatology, Hydrologic data, On-site investigations, On-site data collections, *Alaska.
Identifiers: *Landfast ice, Ice formations, Barrow(Alaska), Pack ice, Ice maps, Ice dynamics, Hummock fields, Ice drift, Pressure ridges, Shear ridges, Ice studies, Topographic features, Artic ice.

During late December 1973, the landfast ice sheet at Barrow broke loose and drifted offshore, following which an intense storm drove the pack ice into the nearshore zone. As a result, a new landfast ice mass was formed, which included a complex array of pressure ridges, shear ridges and hummock fields. The entire process was monitored by radar, and this report provides information on the velocity vector of the pack ice during this time, and on the sequence of events which lead to the formation of the landfast ice. This data, in conjunction with field observations, gives some insight into the mechanisms by which some of the structural features of the landfast ice mass were formed. An important feature of the landfast ice was a linear hummock field about 4 km long, 135 m wide, and with an average elevation of about 3 m. On its offshore side, this 'ice pile' was bounded by a shear ridge which built shortly after the pile under the same conditions of ice drift. The formation of both these features took less than 1.5 hours, and the transition between them is hypothesized to have resulted from the change in water depth along the outer boundary of the shoal. **MAJOR LATE-WINTER FEATURES OF ICE IN NORTHERN BERING AND CHUKCHI SEAS AS DETERMINED FROM SATELLITE IMAGERY,**
Alaska Univ., College. Geophysical Inst.
L. H. Shapiro, and J. J. Burns.
Sea Grant Report No. 75-8, June 1975. 16 p, 9 fig, NOAA Grant No. 02-3-158-41.

Descriptors: *Ice, *Sea ice, Hydrographic analysis, Iced lakes, Oceanography, Marine geology, Satellites(artificial), Alaska, Artic Ocean, Remote reusing.
Identifiers: *Bering Sea, *Chukchi Sea, *Ice formation, Meteorological satellites, Sea ice movements, Sea ice formation, Satellite imagery, Geophysical data, Ice drift, Coastal ice, Shear zones, Pack ice, Spaceborne photography, Geophysical surveys

Imagery from the ERTS-1, DAPP AND NOAA 2/3 VHRR satellite systems were used for identification of recurring features of the movement and distribution of sea ice in the Bering and Chukchi seas during late winter. Data acquired during March and April of 1973 and 1974 show several such features including: (1) a shear zone of variable width along the west coast of Alaska which separates landfast ice from drifting sea ice; (2) an area of generally broken pack ice between Bering Strait and Point Hope; (3) persistent polynya off south-facing coasts, such as that east of Point Hope, south of the Seward and Chukchi Peninsula and south of the larger islands; (4) convergence zones on the north sides of St. Lawrence and Nunivak Islands, and (5) narrow shear zones extending generally southward from the boundaries of Bering Strait and from the east and west ends of St. Lawrence Island. The pattern observed is consistent with a general southward drift of sea ice under the influence of the prevailing northerly winds. Closure of ice against south-facing coasts, reflecting northward ice drift, occurred about 10% of the time. These episodes probably correlate either with short periods of dominately south winds or drift under the influence of north setting currents when prevailing north winds were light. (NOAA)

## 2D. Evaporation and Transpiration

**HYDROLOGICAL STUDIES OF EVAPOTRANSPIRATION AND GROUNDWATER FLOW IN SANDY LAND,**
National Research Inst. of Agricultural Engineering, Hiratsuka (Japan).
R. Kaneko.
In: Systems Approach to Hydrology: Proceedings of the First Bilateral U.S.-Japan Seminar in Hydrology, Hawaii University, Honolulu, January 11-17, 1971. Water Resources Publications, Fort Collins, Colorado, p 444-452, 1971. 5 fig.

Descriptors: *Evapotranspiration, *Groundwater, Dunes, Sand aquifers, Sands, Hydrologic cycle, Infiltration, Lysimeters, Transpiration, Sea water, Impervious soils, Percolation, Water balance, Hydrology, Equations.
Identifiers: *Japan, *Hiratsuka City, Sandy soil.

Groundwater flow from 1953 through 1965 in an almost flat coastal sand dune located 60 km southwest of Tokyo and 3.5 km inland was discussed. Because of the sandy soil, all precipitation infiltrated into the ground and there was no surface runoff. Soil moisture, groundwater level and evapotranspiration were measured and meteorological observations were made. During the 13 years of record, the population increase and development of industry caused a rapid increase of pumpage. Water levels declined and the unconfined groundwater table lowered because of percolation into deeper strata. Transpiration was estimated using precipitation, groundwater flow, groundwater stage, and the relationship between groundwater level and its drawdown corresponding to change in environments. Evapotranspiration indirectly obtained by water balance calculation was more reliable than direct measurements with lysimeters. The rater of groundwater lowering increased with time, rising after rains but generally

ining 400 cm by 1965. (See also W75-12014)

e, Consumptive use, Irrigation, On-site in-
igations, Soil water movement, Soil moisture,
surface flow, Vegetation, Diurnal, Seasonal,
sure head, Tensiometers.
ntifiers: *Water uptake.

Diurnal water movement within a bermudagrass root zone and the uptake of water by the roots was studied in a field plot. A fast response tensiometer-pressure-transducer system was used to measure the hydraulic head. The relations of pressure head to water content and to hydraulic conductivity were determined in situ. Diurnal water content and soil water flux profiles were derived by using the established hydraulic properties. The fast response tensiometer system enabled calculation of flux and water content changes over 2-hour intervals. Diurnal water extraction rates calculated for different depths and times during the growing season yielded evapotranspiration rates that agreed well with rates measured on similar days in previous years using a lysimeter. The water uptake pattern changes rapidly near the surface during the first few days after irrigation. Rewetting within the soil profile occurred in late afternoon at depths where upward gradients were present. The seasonal consumptive-use curve can be estimated from several daily evapotranspiration rates calculated during the growing season. (Sims-ISWS)

## 2E. Streamflow and Runoff

**A PARTICULAR COMPARISON OF ANNUAL MAXIMA AND PARTIAL DURATION SERIES METHODS OF FLOOD FREQUENCY PREDICTION,**
Institute of Hydrology, Wallingford (England).
C. Cunnane.
Journal of Hydrology, Vol. 18, No. 3/4, p 257-271, March, 1973. 1 fig, 9 ref.

Descriptors: *Hydrologic aspects, *Flood forecasting, Flood frequency, Mathematical studies.

A method for comparing the statistical efficiency of the estimate of the T year flood, Q(T), by two different methods has been developed. On the basis of commonly used assumptions it is shown that for return periods greater than about T = 10 years, the annual exceedance series estimate of Q(T) has larger sampling variance than the annual maxima series estimates. For the same range of return periods, the partial duration series estimate of Q(T) has smaller sampling variance than the annual maxima series estimate only if the partial duration series contains at least 1.65 N items, where N is the number of years of record. Identifiers: *Runoff dynamics, Nonlinearity of runoff, Transformation system.

The storm runoff during a flood was described as a transformation system from rainfall to discharge. Three fundamental patterns exist in runoff process and their characteristics are mainly determined by the nonlinearity and the variation properties of the area where runoff occurs. The characteristics of each pattern were analyzed, the transformation operator from rainfall to runoff was presented, and the significance of the nonlinearity of runoff was discussed in terms of system dynamics. Overland and subsurface flows were considered as affected by the properties of the A-layer or the surface substratum. The results presented are applicable to basin sizes of a few hundred square miles. For larger basins, the problems of flood routing and dispersion of the flood wave still await solution. Identifiers: *Lax-Wendroff scheme, *One-dimensional analysis, *Kinematic wave theory, Method of characteristics.

Basin runoff hydrology was modeled by mathematical simulation of overland and streamflows. Mathematical formulation of streamflow behavior by one-dimensional methods of hydraulic analysis and its use in streamflow simulation was dealt with. The simulation technique consisted of a mathematical model of channel reaches and applying flood routing procedures. A classification of model approximations in the system and their hydraulic role in mathematical expressions was described. The models were evaluated under idealized conditions to give physical significance to the channel storage in terms of channel geometry. (See also W75-12014) (Lardner - ISWS)

**THE FLOOD OF APRIL 1974 IN SOUTHERN MISSISSIPPI AND SOUTHEASTERN LOUISIANA,**
National Weather Service, Washington, D.C.
J. H. Chin
Technical Memorandum NWS HYDRO-24, August 1975. 45 p, 16 fig, 4 tab, 13 ref.

Descriptors: *Floods, *Flooding, *Flood data, *Flood damage, *Precipitation excess, Flash floods, Historic floods, Flood discharge, Precipitation(Atmospheric), Weather patterns, Rainfall intensity, Climatology, Storms, Squalls, *Mississippi, *Louisiana.
Identifiers: *Pascagoula River basin, *Pearl River basin, Storm precipitation, Precipitation, Precipitation distribution.

The flood of April 1974 over the Pascagoula and Pearl River Basins in southern Mississippi and southeastern Louisiana ranks among the most severe in terms of crest stages and maximum flood discharge reached. The objectives of this report are to present the meteorological events associated with the flood, in particular the precipitation distribution, and to give a concise account of the flood itself. Emphasis will be placed on events in southern Mississippi, where heaviest storm precipitation fell and where flooding was most severe. This flood was mainly the result of a storm that covered Louisiana, Mississippi, and western Alabama on April 11-15, 1974. Significant incursion of tropical maritime air mass into the region occurred prior to and during the storm. The broad synoptic-scale situation associated with the precipitation was an occluded Low centered over the Midwest together with its frontal system. The major portion of the storm precipitation, however, was due to mesoscale squall line severe storms that developed in the moist environment of the warm sector ahead of the front. Amounts exceeding the 100-yr rainfall were observed at some places in southern Mississippi and at least one site in Louisiana. (NOAA)

**A STUDY OF FLASH-FLOOD OCCURRENCES AT A SITE VERSUS OVER A FORECAST ZONE,**
National Weather Service, Salt Lake City, Utah. Western Region.
Gerald Williams.
NOAA Technical Memorandum NWS WR-100, August 1975, 16 p.

Descriptors: *Flood forecasting, *Flash floods, *Floods, *Flooding, *Flood data, *Maximum probable flood, Flood control, Hydrology, River forecasting, Warning systems, Flood plains, Flood recurrence interval, Weather forecasting, Meteorological data, Rainfall, Forecasting, Rainfall intensity.
Identifiers: Flash flooding, Flash flood studies, Flood studies, Flood predictions, Forecast zones, Flash flood occurrences, Flood occurrences, Meteorological forecasting.

Some relations are described between probability of point rainfall amounts and probability of the same amounts falling some place within an area; i.e., point probability vs. areal probability. Analogously, the relationship between probability of flash-flood occurrences at sites and the probability of flash-flood occurrences somewhere within a forecast zone are also developed. The paper considers and examines unusually heavy rainfall of short duration from convective activity and its closely related partner, flash-floods. Some of the conclusions drawn from the study are that the 100-year 1/2-hour amount of point rainfall probably may occur once every several years somewhere on a 60-square-mile basin. Flash-flood occurrences appear to exhibit similar relationships but over larger areas. Errors in verification of flash-flood watches and warnings may occur when only known flash-flood occurrences are used. Forecast verification may improve if all events are made known and enhancement of accuracy in forecast procedures is probable. (NOAA)

**FLOOD PLAIN INFORMATION: FOUNTAIN CREEK, COLORADO SPRINGS, MANITOU SPRINGS, COLORADO.**
Army Engineer District, Albuquerque, N. Mex.
Prepared for the Pikes Peak Area Council of Governments, August, 1974. 44 p, 9 fig, 16 plates, 5 tab.

Descriptors: *Flood plains, *Flood damage, *Flood plain zoning, *Flood profiles, *Flood data, Land use, Planning, Historic floods, Obstruction to flow, *Colorado, Flood forecasting, Flood proofing.
Identifiers: Fountain Creek(Colo), Colorado Springs(Colo), Manitou Springs(Colo), Flood plain management, Intermediate Regional Flood, Standard project flood, Pikes Peak(Colo), Subdivision regulations.

Fountain Creek, a perennial stream with headwaters fed by glacial snowpacks and springs, rises in the mountains near Pikes Peak, flows through a narrow steep walled canyon. In the upper part of the study area of 120 sq mi, stream slope averages about 90 ft/mi and the valley width averages 400 ft; in the lower part about 63 ft/mi with average valley width of 600 ft. Flood plain is narrow with extensive residential commercial, and tourist development. Flood producing storms occur from May to August when maximum contrast in temperature causes heaviest precipitation. Even more intense rainfall from cloudbursts occurs during July and August. Historical documents and newspaper files give information on past floods which have caused extensive damage. Obstruction to flow is created by 31 bridges, including numerous footbridges and other planked crossings which can be expected to wash downstream. Highest peak discharge in the study reach produced by an Intermediate Regional Flood (IRF) would be 20,500 cfs and by a Standard Project Flood(SPF) 34,000 cfs. At the same location, main channel velocity of an IRF would be 13.1 feet per second and of a SPF, 15.4 feet per second. Both an IRF and a SPF would cause severe damage to Colorado Springs and Manitou Springs, neighboring communities on Fountain Creek. Both cities have enacted subdivision regulations that could be the foundation of effective flood plain management. (Diefendorf-North Carolina)
W75-12372

**FLOOD PLAIN INFORMATION: TONAWANDA CREEK AND ITS AFFECTED TRIBUTARIES, ERIE AND NIAGARA COUNTIES, NEW YORK.**
Army Engineer District, Buffalo, N. Y.
Prepared for Erie-Niagara Basin Regional Water Resources Planning and Development Board, August, 1967. 86 p, 46 fig, 14 plates, 18 tab.

Descriptors: Floods, *Flooding, *Flood control, *Flood plains, Water management(Applied), *New York State Barge Canal, *New York, Flood protection.
Identifiers: *Tonawanda Creek(New York), Erie County(New York), Niagara County(New York), Intermediate Regional Flood, Standard Project Flood.

Flooding along Tonawanda Creek and its tributaries from its confluence with the Niagara River to the easterly limit of Erie and Niagara Counties in western New York state, a distance of 41.5 creek miles, is examined. The lower reach is navigable with very flat channel gradients. Most of the flood plain is agricultural, with scattered residences. Overflow from the narrow winding obstructed channel can occur at all times of year, although major floods occur in the late winter and early spring from snow melt and moderate rainfall. Flood flows in lower reaches are modified by abundant overbank storage. In the upper reaches flooding is of long duration. There are no existing or authorized flood control projects within the study area, and, with the exception of the town of Royalton, none of the communities have flood plain regulations. The largest flood at Alabama, New York, occured January 23, 1959, cresting at 16.0 feet due to ice jams, with peak discharge of 6550 cfs. The March 1960 flood crested at 14.3 feet with peak discharge of 7980 cfs, its impact lessened by removal of an old dam and improvement of the Erie Barge Canal. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) would have peak discharges of 11,500 cfs and

5,200 cfs, respectively. In the Tonawanda Creek Reach between Rapids, New York and the Erie-Niagara and Genessee County line which sustained the most damage and widespread flooding along the creek in 1960, an IRF would cause flooding to be over 1 foot deeper and the SPF 2 feet deeper than 1960 in this area. (Salzman-North Carolina)

**FLUID FLOW IN CHANNELS, CAPILLARIES, AND POROUS MEDIA UNDER THE INFLUENCE OF AN ELECTRIC FIELD.**
Bureau of Mines, Morgantown, W. Va. Petroleum Research Lab.
L. C. Headley, C. I. Pierce, and W. K. Sawyer.
Report of Investigations 7342, January, 1970. 33 p, 15 fig, 1 tab, 24 ref.

Descriptors: Flow, *Electrochemistry, Physical properties, Porous media, Capillary, Conductivity, Aquifer characteristics, *Electric fields, Oil Industry, *Flooding(Oil Recovery).

A series of exploratory tests was conducted to determine the effects of steady electric fields on fluid flow and streaming potential in narrow passages and porous media, the effects of steady electric fields on fluid interfaces, and the influence of internal voltages on fluid flow in a porous porcelain sample. Voltages greater than about 5 kilovolts were found to influence liquip droplets emanating from a capillary tube. Solutions of polyethylene oxide and polyacrylamide in water exhibited widely different behavior than that of other liquids tested. Liquid-liquid displacement tests in porous samples to determine the influence of high voltage applied to the displacing liquid on flow rates and recovery gave no significant differences. No consistently measurable effects were noted, either on flow rate or streaming potential, when an electric field was applied transverse to the direction of flow in porous media and in narrow rectangular or cylindrical channels. Experimental values of formation factor and streaming potential for a porous porcelain sample agreed qualitatively with those calculated from electrokinetic theory for ultrafine capillaries. However, the agreement for the electroviscous effect was not good. (Campbell-NWWA)

**BACTERIAL PROCESSES FOR IMPROVED OIL RECOVERY.**
Tulsa Univ., Okla
J. R. Frick.
Journal of Petroleum Technology, Vol. 24, p 1469-1470, December, 1972. 12 ref.

Descriptors: *Bacteria, Oil, *Clostridium, *Oil spills, *Oil pollution, Oil industry, Oil reservoirs, Clogging, Permeability.
Identifiers: *Desulfovibria hydrocarbonoclasticus, Water-thickening agents, *Oil recovery.

Bacteriological oil recovery is reviewed from its first application in 1946. At that time, the bacteria, Desulfovibria hydrocarbonoclasticus, and aerobe, was injected into an oil producing formation to increase recovery. The four mechanisms of oil release are: (1) production of gaseous carbon dioxide, (2) production of organic acids and detergents, (3) dissolution of carbonates in the rock, and (4) physical dislodgement of the oil. Bacteria of the Clostridium type have been isolated. They reduce heavy hydrocarbons in place to form lighter fractions and gases. Bacteria might also be used for selective plugging in wells. Another possible application is in the underground production of water-thickening agents. (Bradbeer-NWWA)

**STUDIES IN THE SYSTEM CACO3-FECO3: 1. PHASE RELATIONS; 2. A METHOD FOR MAJOR-ELEMENT SPECTROCHEMICAL ANALYSIS; 3. COMPOSITIONS OF SOME FERROAN DOLOMITES,**
Chicago Univ., Dept. of Geophysical Sciences.
J. R. Goldsmith, D. C. Graf, J. Witters, and D. A. Northrop.
Journal of Geology, Vol 70, No 6, p 659-687, November, 1962. 11 fig, 10 tab, 15 ref.

Descriptors: *Dolomite, *Calcite, *Diagenesis, *Phase diagrams, Geochemistry, Thermal properties, Melting, Pressure, Liquids, Gases, Geology, Sedimentology, Ground water.
Identifiers: *Magnesite, *Siderite.

Isothermal sections at 600, 650, 700, 750 and 800C, run for the most part at 15 kilobars total pressure, were obtained using a squeezer-type apparatus. Above approximately 675C the system contains two two-phase and two single-phase areas. A three-phase area in the Mg-poor portion of the system is first detected at 675C and becomes progressively larger at 650C and 600C. Ferroan dolomite, ferroan- magnesian calcite, and calcian-

magnesian siderite coexist in this three phase triangle. The hypothetical compound CaFe (CO3)2, not known in nature, lies in a two-phase field even at 800C. The maximum FeCO3 substitution observed in twenty naturally occurring ferroan dolomites examined is 31% mol, essentially the same as the maximum equilibrium substitution achieved experimentally. Natural ferroan dolomites may be metastable compositionally, therefore the FeCO3 content cannot be used for geological thermometry. A spectrochemical method is described which determines mol% with small root mean square relative errors. (Bradbeer-NWWA)

**EFFECT OF HYSTERESIS ON THE PREDICTION OF INFILTRATION, REDISTRIBUTION AND DRAINAGE OF WATER IN A LAYERED SOIL,**
New Mexico State Univ., University Park. Dept. of Agronomy.
J. H. Dane, and P. J. Weirenga.
Journal of Hydrology, Vol 25, No 3/4, p 229-242, May 1975. 18 fig, 2 tab, 18 ref.

Descriptors: *Soil water, *Hydraulic conductivity, *Hysteresis, *Computer models, Moisture tension, *Infiltration, Drainage, Tensiometers, Darcys law, Irrigation, Sands, Drying, Wetting, Moisture content, Soil water movement.
Identifiers: *Soil columns, Drying curves, Wetting curves.

In order to study the effect of hysteresis on soil water movement, a large soil column filled with Glendale clay loam over a river sand was flood-irrigated with 10 cm water. The infiltration rate, wetting front advance, water content redistribution, and amount of drainage water were measured. A computer model was developed to simulate the flow behavior. The main drying and main wetting curves in the relationship between soil water tension and water content and in the relationship between hydraulic conductivity and water content were provided in the computer model. From these relationships, scanning curves were developed to simulate hysteretic flow behavior under both wetting and drying conditions. Experimental data were compared with data computed from either the main drying, the main wetting, or the scanning curves. Infiltration was accurately predicted using the main wetting curves. However, redistribution and drainage were better predicted when hysteresis was taken into account. (Schicht-ISWS)

**MATHEMATICAL ANALYSIS OF STEADY SATURATED FLOW THROUGH A MULTILAYERED SOIL WITH A SLOPING SURFACE,**
Florida Univ., Gainesville. Dept. of Soil Science.
H. M. Selim, M. S. Selim, and D. Kirkham.
Soil Science Society of America Proceedings, Vol 39, No 3, p 445-453, May-June 1975. 12 fig, 3 tab, 16 ref. NSF Grant GK-31137.

Descriptors: *Saturated flow, *Seepage, *Slopes, *Infiltration, Potential flow, Saturated soils, Soil water movement, Mathematical studies, Mathematical models, Model studies, Hydraulic conductivity, Permeability, Soil water, Groundwater movement, Groundwater potential, Flow, Soils.
Identifiers: Multi-layered soils.

An analytical solution was presented for a two-dimensional multilayered hillside seepage problem. The soil was horizontally stratified with each layer having a different permeability. The flow medium was assumed to be water-saturated to the soil surface, bounded below by an impermeable barrier at a finite depth, and bounded laterally by vertical streamlines. Seepage occurred into the flow medium along the upper part and out along the lower part of the sloping soil surface. Two situations were analyzed, one with a constant slope soil surface and another with an abritrarily shaped soil surface. The potential and stream functions for the problem were developed by starting with a general series solution to Laplace's equation and using a modified Gram-Schmidt method to determine the series coefficients. Solutions were derived for two-layered and three-layered soils. From these derivations, solutions for soils with more than three layers could be readily deduced. The results presented include flow nets, seepage velocities, and infiltration rates for two-layered and three-layered soils. (Sims-ISWS)

Identifiers: *Bonneville Salt Flats, Entrapped air.

The shallow water table at the Bonneville Salt Flats, Utah, fluctuates 1.5 to 6.0 cm per day during the summer and 0.5 to 1.0 cm per day during the winter. Highest water levels occur in late afternoon and lowest levels occur in mid-morning. Similar fluctuations occur in many other localities having shallow, fine-grained aquifers. The fluctuations are attributed to temperature-related atmospheric pressure changes acting on the capillary zone. This proposed mechanism involves the transfer of water from below the water table to the capillary fringe in response to lower pressure, and transfer of water from the capillary fringe to the water table in response to higher pressure. Rapid volume changes of air entrapped in the capillary pores account for the expulsion of infusion of capillary water. Laboratory experiments with an artificial aquifer confirmed that such fluctuations can occur rapidly when the only variable is pressure. In this case no intervening confining layer existed, so the mechanism was distinctly different from the mechanism which causes blowing wells. The correct interpretation of fluctuations of several centimeters can be of considerable importance in monitoring small changes of water levels in manometers emplaced to monitor seepage through dams or levees, or in measuring small drawdowns in observation wells during pumping tests of fine-grained aquifers. (Visocky-ISWS)

Soil Science Society of America Proceedings, Vol 39, No 3, p 391-393, May-June 1975. 4 fig, 1 tab, 3 ref.

Descriptors: *Soil water, *Water measurement, *Instrumentation, *Soil moisture meters, *Spectrometers, On-site tests, Analytical techniques, Electronic equipment, Moisture, Moisture content, Evaluation, Available water, Soil moisture, Soil properties, Moisture availability, Spectrophotometry, Clay loan, Silts, Clays, Sands, Absorption.
Identifiers: *Soil water content, Soil water extraction, Surface soils, Sandy loam, Silt loam, Soil-methanol extract.

A small, portable, battery-powered, spectrophotometer was developed to measure soil water content rapidly. Soil water contents of 16 soils were related to the absorbance at 1.94 micrometers by a soil-methanol extract by the curvilinear equation: Absorbance = K(% soil water/100 + 1.025(% soil water)) + a. With the exception of Houston Black Clay, one equation could be used for all soils. Determination time for individual samples was approximately 15 min. (Henley-ISWS)

tly, integral methods have been developed
rovide accurate approximations to the diffu-
quation with rapidly varying diffusivity, but
e in general some numerical iteration. A new
ical approach was developed which yields
al approximation without any numerical
on. The method was applied to the problem
-dimensional horizontal infiltration of water
s. It was shown that the sorptivity is an in-
t, which can be expressed in terms of the
f two integrals involving the diffusivity. The
ical results were in excellent agreement with
ical calculations for Yolo light clay. Since
ivity for most soils varies even more rapidly
or Yolo light clay, the approach should
even more accurate for most soils. The
que is quite general and can be adapted to
other problems of water movement in un-
ted soils. (Sims-ISWS)

**STATISTICAL INVESTIGATION OF THE RELATION BETWEEN ABSORBABILITY AND CONTENT OF GRAINSIZE FRACTIONS AND HUMUS, (IN RUSSIAN),**
L. N. Kuleshov.
Izv Akad Nauk Az SSR Ser Biol Nauk. No 1, p 26-31. 1973.

Descriptors: Humus, *Absorption, Clays, *Grain, *Statistical studies, *Soils.
Identifiers: *USSR, Chernozems, Azerbaidzhan.

The advantage of statistical analysis for revealing the relation between interrelated properties of soils is demonstrated. Particles larger than 0.005 mm have absorbability. In chernozems of the USSR absorbability is due mainly to humus, the effect of the clay fraction being secondary, whereas in the compact soils of Azerbaidzhan absorbability is governed by the content of clay while the effect of humus is negligible.--Copyright 1974, Biological Abstracts, Inc.

Special Report No 24, March 1975. 88 p, 33 fig, 20 tab, 29 ref.

Descriptors: *Limnology, *Michigan, *Baseline studies, Geology, Soils, Vegetation, Climatic data, Hydrology, Physical properties, Regional analysis, Chemical properties, Dimensions, Water temperature, Hydrogen ion concentration, Conductivity, Heavy metals, Nutrients, Gases, Coliforms, Benthos, Phytoplankton, Zooplankton, Primary productivity, Precipitation(Atmospheric), Radiation, Winds, Ions, Diatoms, Color, Light penetration, Recreation.
Identifiers: *Sylvania Recreation Area(Mich), *Ottawa National Forest(Mich).

As a base for sound management of the Sylvania Area 14 lakes were studied. Differences resulted from varying groundwater inflow. Drainage lakes had the lowest sulfate, highest calcium, magnesium, sodium, silica, potassium, chloride, iron, phosphorus, and nitrate; larger watersheds and groundwater inflow; and were mesotrophic-oligotrophic and eutrophic. Seepage lakes had the highest sulfate, lowest concentrations of all other chemicals, and were mesotrophic-oligotrophic. There was an inverse relationship between color and transparency. Iron concentrations were re-

lated to transparency. Seston concentrations caused seasonal transparency fluctuations. In productive lakes, summer dissolved oxygen concentrations decreased uniformly from surface to bottom. Nutrient-poor lakes had oxygen maxima in the epilimnion which decreased with depth in summer. Anaerobic conditions in the hypolimnia caused low benthic populations as indicated by the predominance of Chaoborus populations. Fragilaria pinnata and F. crontonensis were associated with drainage lakes. Melosira, Cyclotella, and non-diatoms were abundant in seepage lakes. Seven species of copepods and cladocerans were present, but Leptodiaptomus minutus was absent in drainage lakes, some copepods were absent and phytoplankton low in bog lakes. Studies on responses of the Experimental Lakes Area of Canada to fertilization should be considered in management decisions concerning Sylvania lakes. (Buchanan-Davidson-Wisconsin)

**THE LAKE AS ECOSYSTEM,**
G. H. Schwabe.
Universitas, Vol 16, No 3, p 213-226, 1974.

Descriptors: *Lakes, *Ecosystems, Limnology, Biological properties, Life cycles, Balance of nature.

Inland water bodies are equated with ecosystem models. Water availability is the indispensable basic material for all biotic processes. Geological age, relatively homogeneous salt concentration, low, fluctuating dissolved substance contents distinguish oceans from inland waters. Inland water bodies are sections of the earth's surface exposed to the sun's radiation and are components of the ecosphere, an indistinctly contoured boundary at the base of the atmosphere. Since light cannot penetrate the earth, organic substance formation is possible only on the surface. Light can penetrate water, and with dissolved inorganic ingredients and water's high density and viscosity, plants can develop along special pathways. Plankton are found in every stationary water body, are the most impressive community of organisms, and reflect a lake's ecological character. Photosynthesis of organic substance is the fundamental process of life, but cannot ensure permanent continuation of the total life process. Lakes have characteristic biocoenoses, are internally balanced systems of plant and animal populations, are subject to fluctuations of physical conditions, but may themselves modify these conditions, they can maintain a balance under wide ranging external conditions, are limited to a self-contained water mass, and cannot be extracted from the ecosphere. Identifiers: *Circadian rythms(Fish), Laurentians, Lepomis-Gibbosus, Perca-flavescens, Quebec, *Lake Quenouille(Quebec), *Pumpkinseed(Fish).

A knowledge of the circadian rhythms of fish and their displacement patterns is important for the pursuit of fish population studies and for the rational management of fishery resources. A study of lake Quenouille (a small warm shallow water lake in Quebec, Canada), involving gill net fishing during 4 consecutive weekends, had led to the following observations: the yellow perch (Perca flavescens) and the pumpkinseed (Lepomis gibbosus) are diurnal fishes exhibiting maximal activity from 8-9 h and 9-11 h respectively; the brown bullhead (Ictalurus nebulosus) is noctural, exhibiting maximal activity between 22 h and 2 h. A study of fish deplacement patterns revealed that the average angle of displacement with respect to the shoreline was 68-69 degrees for the yellow perch and pumpkinseed and 90 degrees for the brown bullhead.--Copyright 1974, Biological Abstracts, Inc.

**VARIATIONS OF THE TURBULENT FLUXES OF MOMENTUM, HEAT AND MOISTURE OVER LAKE ONTARIO,**
Atmospheric Environment Service, Toronto (Ontario).
G. A. McBean, and R. D. Paterson.
Journal of Physical Oceanography, Vol 5, No 3, p 523-531, July 1975. 7 fig, 2 tab, 10 ref.

Descriptors: *Lake Ontario, *Turbulence, *Variability, Moisture, Momentum transfer, Latent heat, Water vapor, Atmosphere, Instrumentation, Aircraft, Time series analysis, Thermometers, Winds, Temperature, Evaporation, Upwelling, Wind velocity, Radiosondes.
Identifiers: *Internation Field Year for the Great Lakes, Doppler radar, Momentum flux, Sensible heat, Time histories, Sensors, Radiation thermometer.

During the International Field Year for the Great Lakes, measurements of turbulence and turbulent fluxes were made with an instrumented jet aircraft. After removing effects of aircraft motion, the fluxes were computed by the eddy correlation method. Flights were made along the north shore, along the center of the lake, and across the shoreline on four days in October 1972 at a flight level of 150 m. Flights were made at levels 30, 60, 150, and 300 m over another location on the lake. The horizontal variations in the fluxes at 150 m above the surface were illustrated and their relationship to the surface pattern discussed. It was found that the 150 m pattern was displaced downstream about 15 km. The heat flux pattern showed considerable horizontal variation. These variations, coupled with a downwind displacement at higher levels, added to the difficulties in estimating the fluxes from a few measurements. The fluxes did show an approximately linear decrease with height. Further work is indicated before the fluxes of momentum, heat, and moisture from a large lake can be completely understood. riptors: Plant management, Plant physiology, phytes, Halophytes, Salt tolerance, Drought nce, Aquatic plants.
ifiers: *Chenopodiaceae, *Matric water.

ic water (matric-bound water) was measured e water retained by plant material after bration on a pressure membrane or ultra At increasing pressures, lower amounts of are held by matric or colloidal surface s. Matric water was expressed as a percent of the dry weight or the original water content. material was oven dried, ground, and then ited with water prior to the matric determina- which occurred in the pressure membrane as either 1 bar or 20 bars, supplied by ler N for 72 h. Matric water was measured in s or in photosynthetic stem tissues from 60 es, including hydrophytes, xerophytes and hytes. The correlations between matric tials and drought and salt tolerance ratings determined. High matricbound water values ll as high tissue water contents were found in es of Chenopodiaceae, which are considered salt and drought tolerant than species of plant groups. Low matric water values were in the coniferous tree leaves and in grasses, ntermediate values were found in Com- e, miscellaneous herbaceous species, and ious trees. No correlation could be found en either salt or drought tolerance ratings ie matric percent when the latter was ex- d on a dry weight basis. When matric water xpressed as a percent of the original water t, there was a positive correlation with nt tolerance ratings in all families studied ex- ucculent Chenopodiaceae.--Copyright 1974, ical Abstracts, Inc.

**WATER RELATIONS OF HEMLOCK A CANADENSIS): I. SOME EQUILIBRI- VATER RELATIONS AS MEASURED BY RESSURE-BOMB TECHNIQUE,**
o Univ. (Ontario). Dept. of Botany.
Tyree, J. Dainty, and M. Benis.
Bot, Vol 51, No 8, p 1471-1480, 1973. Illus.

ptors: *Hemlock trees, *Water balance, rement, Turgidity analysis.
iers: Tsuga-canadensis, Measuring ques, *Pressure-bomb measurement.

tical and experimental aspects of the rium water relations of excised hemlock (T. nsis) shoots are examined. The equilibrium relations of hemlock were determined by ne pressure-gomb technique on shoots 15-40 sh weight. At or near full turgor the osmotic e of the cells averages 16.5 plus or minus s. The fraction of the total water content of k shoots residing in the living cells is 0.77 minus 0.04. When hemlock shoots are near rgor the balancing pressure will change with the volume expressed provided the changes represent less the 1/2% of the hoot water. **THE WATER RELATIONS OF HEMLOCK (TSUGA CANADENSIS): II. THE KINETICS OF WATER EXCHANGE BETWEEN THE SYM- PLAST AND APOLAST,**
Toronto Univ. (Ontario). Dept. of Botany.
M. T. Tyree, and J. Dainty.
Can J Bot, Vol 51, No 8, p 1481-1489, 1973. Illus.

Descriptors: *Hemlock trees, *Water balance, Physical properties, *Mode of action, Plant growth, Analysis.
Identifiers: Apoplast, Symplast, Tsuga-canadensis, *Pressure-bomb measuring technique, Water exchange.

A theoretical analysis of the events that occur while a plant enclosed in a pressure bomb evolves from 1 equilibrium balancing pressure to another is presented. The initial rate of efflux from any 1 cell in response to a pressure increment of delta P equals (ALp)1 delta P, where (ALp)i is the surface area times hydraulic conductivity of the cell's semipermeable membrane(s). If the volume changes and pressure increment are small, the cell will approach equilibrium exponentially. The 1/2 time of the exponential process is governed by (ALp)iki, where ki is the cell constant ( = the combined rate of change of osmotic and turgor pressure with the volume expressed from the cell). Experimental studies of the kinetics of water exhange between the symplast and apoplast of hemlock (T. canadensis) shoots in a pressure bomb reveal that the cells collectively behave as though they fall into 3 distinct populations which approach equilibrium with different 1/2 times. **THE WATER RELATIONS OF HEMLOCK (TSUGA CANADENSIS): III. THE TEMPERA- TURE DEPENDENCE OF WATER EXCHANGE IN A PRESSURE BOMB,**
Toronto Univ. (Ontario). Dept. of Botany.
M. T. Tyree, M. Benis, and J. Dainty.

Descriptors: *Hemlock trees, *Water balance, *Temperature, Physical properties, Equations, *Mathematical studies, *Water utilization.
Identifiers: Apoplast, Symplast, Tsuga-canadensis, Arrhenius rate theory, *Pressure-bomb technique.

The pressure-bomb technique was used to measure the temperature dependence of water exchange between the apoplast and symplast of hemlock (T. canadensis) shoots. By applying the Arrhenius rate theory, the activation energy for water exchange in the whole shoot equals 25.9 plus or minus 0.6 x 10 to the 3rd power J/mole. A theory is proposed on the basis of the Arrhenius rate equations which allows prediction of the relative magnitudes of the membrane resistance, Rm, and the extracellular resistance, Rx, to water permeation. On this basis Rm may be at least one-quarter of Rx and may even exceed Rx. (See also W75-11900)--Copyright 1974, Biological Abstracts, Inc.

**FUNGUS DISEASES OF WHEAT ON IR- RIGATED LANDS. (IN RUSSIAN),**
Volgograd Agricultural Inst. (USSR).
A. V. Malikova.
Mikol Fitopathol, Vol 8, No 1, p 63-64, 1974.

Descriptors: *Wheat, Plant diseases, USSR, *Soil fungi, *Irrigation effects, *Rusts, *Powdery mildew.

Wheat is affected by the same diseases on irrigated and unirrigated lands, but under irrigation conditions fungus development is slightly different. Under irrigation conditions the development of leaf rust and powdery mildew is intensified, whereas the development of root rot of spring wheat decreases considerably. Wheat plants cultivated under optimum moisture conditions were less infected with loose smut. With an increase of the irrigation rate and N application, the infection of plants with leaf rust and powdery mildew increased.--Copyright 1974, Biological Abstracts, Inc.

**PHENOLIC COMPOUNDS OF WHEAT LEAVES UNDER DROUGHT STRESS,**
Oklahoma State Univ., Stillwater. Dept. of Botany and Plant Pathology.
S.-D. Tsai, and G. W. Tood.
Phyton Rev Int Bot Exp, Vol 30, No 1/2, p 67-75, 1972.

Descriptors: *Leaves, *Chemical analysis, Chromatography, *Phenols, *Moisture stress, Drought tolerance, Plant physiology, *Wheat, *Crop response.
Identifiers: Wheat.

Leaf samples were extracted and analyzed for their content of phenolic compounds by 2-dimensional paper chromatography. They were subdivided into 3 fractions: (I) Free phenolics soluble in 40% and 95% ethanol; (II) Soluble in 40% ethanol but insoluble in 95% ethanol hydrolyzable with NaOH; and (III) Insoluble in 40% hydrolyzable with NaOH ethanol. UV-Absorbance of 40% ethanol-soluble materials at wave length of 275 nm was increased as a result of severe drought in the drought-susceptible cultivar 'Ponca' but did not change in drought-resistant 'KanKing.' Analysis by the Folin-Denis test showed a 25-27% decline in phenolic compounds as a result of water stress in both cultivars, mostly due to a decline in fraction (II). Twenty compounds were tentatively identified of a total of about 37 spots that were located. Of these, 3 disappeared following drought in both cultivars and 5 others showed substantial declines. Two unknown compounds appeared as a result of drought in both cultivars. If phenolic compounds are involved in cellular injury following drought stress this might be due to release of these substances into the cytoplasm rather than to increased synthesis.--Copyright 1973, Biological Abstracts, Inc.

**DISTRIBUTION OF SOLAR RADIATION WITHIN A DECIDUOUS FOREST,**
National Oceanic and Atmospheric Administration, Oak Ridge, Tenn. Air Resources Atmospheric Turbulence and Diffusion Lab.
B. A. Hutchison, and D. R. Matt.
In: 1973 Annual Report; Report ATDL-106, Air Resources Atmospheric Turbulence and Diffusion Laboratory, Oak Ridge, Tennessee, p 1-30, December 1974. 15 fig, 1 tab, 7 ref.

Descriptors: *Solar radiation, *Deciduous forests, *Frequency curves, Forests, Radiation, Light intensity, Canopy, Light penetration, Vegetation, Cloud cover, Distribution patterns, On-site investigations, Microenvironment, Atmosphere, Photometry.
Identifiers: Radiation flux densities, Tulip poplar.

It has long been recognized that the time distribution of radiative flux densities within vegetative stands depart from Gaussian. As early as 1911, it had been noted that time averages of radiation in a spruce forest were meaningless owing to the non-normality of the distribution of radiation values. In general, time distributions reported in the literature are unimodal and skewed to higher flux densities. Most of these studied deal only with radiation reaching the forest floor. As part of the U.S. International Biological Program Eastern Deciduous Forest Biome effort at Oak Ridge, the distribution of solar radiation is being studied in a tulip poplar (Liriodendron tulipifera) forest in vertical and horizontal space and the temporal changes in this distributions . Results indicated that time distributions of flux densities in this forest are non-normal. Further, the amount of skewness increases with elevation in this forest. Time distributions of flux densities were compared for days having complete overcast, for clear days, and for days of varying cloud cover and type. It was found, within the forest, the distributions of flux densities are similar on all days and that increasing cloudiness only narrows the distribution curve and decreases the amount of skewness. Identifiers: Alburnoides-Bipunctatus, Barbus-Barbus, Chondrostoma-Nasus, Cobitis-Taenia, *Czechoslovakia(Rokytna River), Gobio-Gobio, Leuciscus-Cephalus, *Barbel zone(Streams).

A total of 28 spp. of fishes and 2 interspecific hybrids were ascertained in the Rokytna River (Czechoslovakia). Of that number, 10 spp. occur in the stream due to stocking by anglers, or invasion from ponds. In all, 18 spp. are indigenous in the stream, reproducing naturally. In the past, the species composition of the fish fauna of the stream has changed little, except for Cobitis taenia whose habitat was destroyed by amelioration measures. Most of the stream can be characterized as the barbel zone; the upper part of the stream is unsettled and the spring region is a trout zone. In the lower and middle reaches of the stream abundance fluctuated around 10,000 fish/ha, and twice that number in the upper reaches of the Rokytna River and its tributary, the Rouchovanka Stream. Chondrostoma nasus, Leuciscus cephalus and Barbus barbus, are of fishery importance. Gobio gobio and (Alburnoides) bipunctatus were also numerically important. In sections outside the trout zone, the biomass varied between 500 and 600 kg/ha; within the trout zone it did not exceed 300 kg/ha.--Copyright (c) 1974, Biological Abstracts, Inc.

**LIFE HISTORY NOTES AND MERISTIC VARIATION IN THE FRESHWATER FOURSPINE STICKLEBACK, APELTES QUADRACUS (MITCHILL), NEAR SEPT-ILES: QUEBEC,**
Ottawa Univ. (Ontario). Dept. of Biology.
G. Power, and B. W. Coad.
Nat Can (Que)., Vol 100, No 3, p 247-251, 1973.

Descriptors: *Sticklebackes, *Life history studies, *Canada, Fish food organisms, Diptera, Ecology, Crustaceans, Mayflies, Freshwater fish, Fish population.
Identifiers: Apeltes-Quadracus, *Meristic variation, Quebec, Sept-Iles

An isolated freshwater population of the fourspine stickleback was examined for aspects of its ecology and meristic variation. Three age groups were found but only females survived into a 3rd yr of life. Egg numbers and diameters were determined during the breeding season, June-July. Older fish had more and larger eggs. The diet consisted of Chironomidae larvae, Cladocera and Ephemeroptera larvae. Vertebral and gill raker number were lower in the freshwater population compared to a marine population but fin ray counts were similar. The significance of these similarities and differences is discussed. The freshwater population was probably isolated from a marine counterpart by formation of a waterfall several thousand years ago.--Copyright (c) 1974, Biological Abstracts, Inc.

**ROLE OF EPIDERMAL CELL TURGOR ON STOMATAL REGULATION IN ISOLATED EPIDERMAL PEELINGS OF CITRULLUS COLOCYNTHIS LINN. (SCHRAD.),**
Jodhpur Univ. (India). Dept. of Botany.
M. C. Bhandari, and D. N. Sen.
Biochem Physiol Pflanz (BPP), Vol 164, No 2, P 180-187. 1973.

Descriptors: *Stomata, Systematics, Epidermis, Osmatic pressure, Plant growth.
Identifiers: *Citrullus-Colocynthis, *Epidermal, Cell turgor, Plasmolysis, Starch, Turgor.

Epidermal cell turgor appeared to play a definite role in the regulation of stomatal pores in isolated epidermal peelings of C. colocynthis. Guard cells and their surrounding epidermal cells had different osmotic potentials and absorbing capacities. Plasmolysis in epidermal cells caused by incubating peelings in suitable sucrose solutions, led to the lowering of their turgor potentials, which resulted in opening of the stomata. Any increase in turgor potential of epidermal cells caused by incubation of such peelings in water resulted in closure of stomata. Water from plasmolysed epidermal cells was taken up by guard cells due to greater difference of osmotic potentials between epidermal cells and guard cells than between epidermal cells and the incubation medium. When peelings with plasmolysed epidermal and guard cells were incubated in water, water moved into the guard cells from the medium because of its non-availability in plasmolysed epidermal cells. As the pore opened, the starch in guard cells disappeared, but the cause of this could not be ascertained.--Copyright 1974, Biological Abstracts, Inc.

ers: Emergency overflow.

and sedimentation have increased greatly ncreased urbanization, which exaggerates blem by upsetting the balance nature has ed between rainfall and runoff. Settling an be utilized in an analysis of a sediment basin. Settling depends upon the rate of inflow, basin area, flow velocity through the basin, and the settling velocity of the particles. Because a construction project is usually completed within a year, it is reasonable to design a sediment basin to remove the peak silt load that would be generated by a one-year frequency storm. The one-year frequency flood can be calculated using suitable values of one-year rainfall intensity, time of concentrations, and runoff factor. The facility needs to be kept in good working order to perform satisfactorily. (Singh-ISWS)

Identifiers: *Scioto River Basin(Ohio), Celestite.

Groundwater that emanates from carbonate bedrock in the Scioto River drainage basin is characterized by Sr87/Sr86 ratios in the range of 0.708 to 0.709; usually high Sr/Ca ratios in this water identify celestite lenses within the carbonate bedrock as the dominant source of strontium. Groundwater from clastic bedrock, principally shale, has Sr87/Sr86 ratios that vary from about 0.710 to about 0.713 and shows low Sr/Ca ratios. Thus, there are two basic groundwater types that emanate from bedrock within the basin. They can be identified by these two parameters. Most groundwater that has been in contact only with glacial till, which covers the northern two-thirds of the basin, has carbonate-type Sr87/Sr86 ratios as well as high Sr/Ca ratios. Celestite is apparently present in the till throughout much of the Scioto Basin. Groundwater that contains celestite-derived strontium, whether from the carbonate bedrock or the till, has so great a strontium content as to control completely the Sr87/Sr86 ratios of surface water northwest of the glacial boundary. This fact limits the usefullness of the Sr87/Sr86 parameter as a tracer in water studies within the basin. (Visocky-ISWS)

Identifiers: British Columbia, *Chub (Peamouth), Mylocheilus-Caurnius, Vancouver Island (B.C.), Zoo geographic studies, Fraser River (B.C.), Straits of Georgia (B.C.).

In British Columbia, the postglacial distribution of the peamouth chub, M. caurinus, is limited to certain mainland drainages except for several problematical island occurrences, including Vancouver Island (British Columbia, Canada). The saline waters of the 30-mi wide Strait of Georgia evidently act as a barrier to island dispersal. However, during periods of very high runoff from the Fraser River, a corridor of low-salinity water is established between the mouth of the Fraser River and Vancouver Island. For primary-division freshwater fish, the probably constitutes a sweepstakes emigration route consisting of a shallow surface gradient with terminal salinities occasionally falling to levels which peamouth chub can tolerate. In a simulated crossing of Georgia Strait, peamouth chub demonstrated superior survival capabilities in comparison to 3 other freshwater species. The study lends support to the idea that the presence of chub in the Nanaimo River system on Vancouver Island represents a natural postglacial range extension.--Copyright (c) 1974, Biological Abstracts, Inc.

**STORM TIDE FREQUENCIES ON THE SOUTH CAROLINA COAST,**
National Weather Service, Silver Spring, Md.
V. A. Myers.
Superintendent of Documents, U.S. Printing Office, Washington, D.C. 20402, for $1.45. NOAA Technical Report NWS-16 June 1975. 79 p, 33 fig, 8 tab, 43 ref.

Descriptors: *Storm surge, *Tides, *Flood forecasting, Hurricanes, Storms, Climatology, Floods, Disasters, Rainfall, Precipitation(Atmospheric), Ocean waves, Tsunamis, Weather forecasting, Weather, Hydrology, *South Carolina.
Identifiers: Tidal currents, Storm tide frequencies, *Storm tides, Flood Insurance Program, Coastal tides, Tide predictions, Hurricane predictions, Hurricane occurrences, Hurricane tides, Flood hazards, Tide frequencies.

Methods are described for estimating hurricane tide frequencies on a coast by applying the National Weather Service hydrodynamic storm surge model to a full set of climatologically representative hurricanes. The first purpose is to provide technical documentation of the coastal tide frequency determination for an area of South Carolina that includes the five maritime counties; Beaufort, Colleton, Charleston, Georgetown, and Horry; the cities of Charleston, Beaufort, Georgetown, and Myrtle Beach; and a number of townships and towns. The second purpose is to describe and illustrate by example the methods used by NOAA for tide frequency determination along any hurricane-prone coastal reach. It provides and explains the basis for hurricane tide frequencies for all of the open coast of South Carolina from an annual probability of occurrence of 0.10 to an annual probability of 0.002 (mean recurrence interval 10 yr. to 500 yr.). The motivation for this report is the Flood Insurance Program which uses the results to define flood risk zones. (NOAA)

Descriptors: *Tides, *Tidal streams, *Tidal waters, *Currents(Water), *Inlets(Waterways), Ocean currents, Sea level, Water levels, Oceanographic data, Tidal effects, Maps, *Alaske, Hydrologic data, Water level fluctuation.
Identifiers: *Cook Inlet(Alaska), Tidal stream atlas, Current Atlas, Tide calculations, Current estimations, Current predictions, Current levels, Tidal model, M2 tide, Neap tides, Spring tides, Anchorage currents, Low tides, High tides, Tidal levels.

The purpose of this tidal stream atlas is to provide oceanographers and engineers with a convenient means of estimating currents in Cook Inlet. The currents were computed using a numerical tidal model whose original purpose was that of calculating the distribution of the amplitude and phase of the M2 tide Cook Inlet. The numerical model used as input was for the M2 tide across the seaward entrance of Cook Inlet, and was adjusted so as to give the best possible agreement between the computed and actual amplitude and phase Anchorage. As the differences between the computed and observed values throughout the re the inlet were small (in all cases less than 8% ference in amplitude and in phase) it was dec that the associated current amplitudes and ph would also be reasonably accurate and would vide information suitable for oceanographic o gineering use. The assumption was made tha ratios between Neap tides and Spring tides f M2 tide amplitude (0.8 and 1.6 throughout mu Cook Inlet) would hold good also for the curr Having computed the Neap and Spring curren was decided that the most convenient reference point would be the effective daily range at Anchorage taken from the tide ta (NOAA)

SS FOR DEMINERALIZING WATER,
o Nazionale delle Ricerche, Rome (Italy).
e).
, and R. Passino.
atent No 3,901,781, 3 p, 3 ref; Official of the United States Patent Office, Vol 4, p 1416, August 26, 1975.

ors: *Patents, *Water treatment, *Water control, *Water purification, *Water ontrol, *Demineralization, *Pre-treatment Electrodialysis, Ion exchange, Resins, xchange.

ss for demineralizing water is disclosed mprises of a combination of a pre-treat- the water and an electrodialysis process neralization. The invention provides a ment system for the feed water to an elec- is demineralization plant where the water able alkalinity content. The pre-treatment he composition of the materials dissolved to reduce concentration and ohmic on resistances; to avoid scale formed by sits from the feed water; to remove from water colloidal substances which would precipitate on the membranes; to raise ity of actual current, increasing the f product and decreasing the specific d chemical reactant requirements; and to uric acid also at high concentration, in- ydrochloric acid, thus enabling an addi- nomy. The pre-treatment consists in an nge treatment carried out by using ion resins of a cation type to replace in the be fed to an electrodialysis process, the hard cations with H+ and Na+ ions, separately or together, using H+ to neutralize the HCO3- ions. The pre-treatment also regenerates the exhausted ion exchange resins. (Sinha-OEIS)

ON THE COMPARISON OF REVERSE OSMOSIS MEMBRANE PERFORMANCE,
Zagreb Univ. (Yugoslavia). Inst. of Physical Chemistry.
B. Kunst, G. Arneri, and Z. Vainaht.
Desalination, Vol 16, No 2, p 169-177, April, 1975. 4 fig, 3 tab, 10 ref.

Descriptors: *Reverse osmosis, *Membrane processes, Analytical techniques, Pressure, Porosity,Physical properties, Performance.
Identifiers: Pressure sensitivity.

Methods of comparing the operational performance of different reverse osmosis membranes are analyzed. The inherent porosity of a membrane was shown to affect systematically the extent of concentration polarization at the high pressure side of the film. The development of a proposed method for determining the value of membrane flux needed to compare various membranes is documented. It was shown that the inherently more porous Batch 316- and 400-type reverse osmosis membranes do not show improved performances at the highest operating pressures (102atm). This is due to the tendency of high pressure to close the small-size pores that are initially generated in these types of membranes. The pressure sensitivity of such membranes, caused by the increased concentration polarization above the more porous membranes, should be considered when comparing the performances of different reverse osmosis membranes. (Kramer-FIRI.)

INNOVATIVE WORKOVER FOR WASSON WATER WELLS,
F. Holasek.
Water Well Journal, Vol 29, No 5, p 76-77, May, 1975. 1 fig.

Descriptors: *Water wells, *Wells, *Water supply, *Specific capacity, *Water yield, Dependable supply, Groundwater, Reservoir supply, Water supply development, Flow rate, Sand aquifer, *Texas.
Identifiers: Production rate, Gaines County(Tex), Ogallala aquifer.

The Wasson water field, Gaines County, Texas, supplies several major petroleum companies with water for secondary oil recovery processes. The wells produce from the Ogallala and Cretaceous formations at about 200 feet. A recent increase in the production rates of the existing wells was made by removing the gravel packs and washing the formation with a high velocity water-jet containing abrasives. Wells treated in this way increased in production considerably. For example, the first well treated increased in production rate from 190 gpm to 650 gpm after treatment. (Bradbeer-NWWA)

SOUTHERN NEVADA WATER PROJECT.
Water and Sewage Works, Vol. 120, No. 4, p 68-70, May, 1973. 6 fig.

Descriptors: *Water supply, *Water sources, Water table, Reservoirs, Tunnels, Pumps, Population, Construction, *Nevada.
Identifiers: Las Vegas(Nev.), Lake Mead(Nev.).

Between 1960 and 1970 the permanent population of Las Vegas, Nevada increased from 127,000 to 270,000. Under this pressure, the water table was dropping at a rate of 10 feet per year. In some places the ground actually sank. To solve the problem, the Bureau of Reclamation worked with city, state, and federal governments to find a new source of water for Las Vegas and the surrounding area. A 200-foot deep reservoir was blasted from the rock about 1.5 miles from Lake Mead and a lateral tunnel was drilled to connect the new reservoir to the lake. The motors for ten turbine pumps were installed in a building constructed on top of the reservoir. The pumps were lowered 120 feet to lift the water for transportation to the city. The pumps are capable of pumping as much as 200 mgd to the Las Vegas area. The water flows four miles through a 12-foot diameter tunnel through an adjacent mountain range. (Sandoski-FIRI.)

WEATHER MODIFICATION: WHERE ARE WE NOW AND WHERE SHOULD WE BE GOING. AN EDITORIAL OVERVIEW,
National Hurricane and Experimental Meteorology Lab., Coral Gables, Fla.
R. I. Sax, S. A. Changnon, L. O. Grant, W. F. Hitschfield, and P. V. Hobbs.
Journal of Applied Meteorology, Vol 14, No 5, p 652-672, August 1975. 71 ref.

Descriptors: *Weather modification, *Reviews, *Meteorology, Cloud seeding, Artificial precipitation, Hail, Fog, Clouds, Cloud physics, Hurricanes, Orography, Water resources, Water supply, Droughts, Water management(Applied), Precipitation(Atmospheric), Political aspects, Agroclimatology, Artificial storms, Research priorities.
Identifiers: Inadvertent weather modification, Hail suppression, Orographic precipitation, Convective clouds, Fod modification, Hurricane modification.

Attention was focused on where we are now and where we should be going with respect to several important areas of weather modification. These areas were: (1) inadvertent mesoscale weather and climate modification, (2) hail suppression, (3) weather modification for augmenting orographic precipitation, (4) convective cloud modification, (5) hurricane modification, (6) weather modification for water management, and (7) fog modification. The discussion was mainly editorial in nature

and represented the opinions of the authors. It was concluded that considerable progress has been made in weather modification during the past quarter-century. Progress has been slower in some areas than in others, but the overall feeling is optimism--Optimism that the scientific problems of today can be solved by careful research in the future. (Sims-ISWS)

**ON THE VARIABILITY OF 'DYNAMIC SEEDABILITY' AS A FUNCTION OF TIME AND LOCATION OVER SOUTH FLORIDA: PART I. SPATIAL VARIABILITY,**
National Hurricane and Experimental Meteorology Lab., Coral Gables, Fla.
W. R. Cotton, and A. Boulanger.
Journal of Applied Meteorology, Vol 14, No 5, p 710-717, August 1975. 12 fig, 11 ref.

Descriptors: *Weather modification, *Cloud seeding, *Florida, *Sounding, Atmosphere, Cloud physics, Atmospheric physics, Model studies, Mathematical models, Artificial precipitation, Nucleation, Air masses, Temperature, Humidity, Meteorology.
Identifiers: *Atmospheric soundings, Cumulus models.

Using a one-dimensional cumulus model, predictions of the effects of seeding cumulus clouds were performed during the month of July 1973 as a part of the Experimental Meteorology Laboratory FACE 1973 Experiment. The calculations were performed with the Miami 1200 GMT soundings and soundings taken in the interior of Florida at 1400 GMT at the so-called Central Site (CS) location. A comparison of 'seedability' predictions using the Miami 1200 GMT and CS 1400 GMT soundings have shown that substantial differences between the two seedability predictions occur on a number of days in spite of the fact that the soundings are separated in time by only 2 h and in space by only 110 km. The differences can be attributed to the frequent intrusion of dry air masses of varying height and thickness. The intensity of the dry layers are generally greatest over the higher-latitude CS location. The greatest differences between the two soundings, and hence the greatest difference between the predicted seeding effects, occurred during periods of transition from a disturbed, westerly flow regime to a well-defined, deep, easterly flow regime. (Sims-ISWS)

**A DETAILED MICROPHYSICAL SIMULATION OF HYGROSCOPIC SEEDING ON THE WARM RAIN PROCESS,**
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
R. D. Farley, and C. S. Chen.
Journal of Applied Meteorology, Vol 14, No 5, p 718-733, August 1975. 15 fig, 2 tab, 41 ref, 2 append. Bureau of Reclamation 14-06-D-6796, NSF GA-36910X.

Descriptors: *Weather modification, *Model studies, *Cloud seeding, Cloud physics, Salts, Mathamatical models, Nucleation, Advection, Condensation, Coalescence, Raindrops, Drops(Fluids), Artificial precipitation, Precipitation(Atmospheric), Meteorology
Identifiers: *Cloud models, Warm rain process, Drop breakup.

The Wisner one-dimensional time-dependent model has been modified to allow the condensed water forms to be represented by 52 logarithmically spaced size categories covering a range of just under 2 micrometers radius to slightly less than 5 mm radius. The size distribution of the water drops was allowed to evolve with time as a result of the physical processes of vertical advection, condensation/evaporation, stochastic coalescence, and drop breakup. Salt seeding was simulated by introduction of a distribution of raindrop embryos at cloud base for a specified period of time. The raindrop embryo distribution was derived from calculations on the diffusional growth of a distribution of salt particles in the unsaturated air below cloud base. This model was applied to the 23 July 1970 salt seeding case near Rapid City. This 'detailed microphysical' study has indicated that salt seeding can be effective in stimulating the warm rain process only if breakup-induced chain reactions result. In order for the chain reaction to develop, high vertical velocities (greater than 10 m/s) are required. Salt seeding acts mainly as a catalyst in initiating this Langmuir-type chain reaction. Without breakup, salt seeding has little effect other than to allow a few of the big drops to fall out of the model clouds. Breakup acting alone may cause the model clouds to precipitate but much longer periods are required than when seeding and breakup are combined. The effects of salt seeding and breakup induced chain reactions are also strongly dependent on the dynamics of the model cloud. (Sims-ISWS)

**FLORIDA AREA CUMULUS EXPERIMENTS 1970-1973 RAINFALL RESULTS,**
Virginia Univ., Charlottesville. Dept. of Environmental Sciences; and Virginia Univ., Charlottesville. Center for Advanced Studies.
J. Simpson, and W. L. Woodley.
Journal of Applied Meteorology, Vol 14, No 5, p 734-744, August 1975. 16 fig, 9 tab, 26 ref.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, *Florida, Rainfall, Clouds, Cloud physics, Silver iodide, Mathematical models, Networks, Rain gages, Radar, On-site investigations, Sampling, Analytical techniques, Evaluation, Meteorology.
Identifiers: *Cumulus clouds, Cloud mergers.

After four summer periods of randomized experimentation with dynamic cumulus seeding in a 13,000 sq km target area in south Florida, 14 seed and 23 control cases are available, with increased documentation of radar measurement accuracy. Seed-control rainfall comparisons are made for 'floating' and total target for the 6 hour period following the first seeding. On days screened as suitable for the experiments, natural rain volume varied by a factor of 62 for floating target and by a factor of 25 for total target. Area seed-control rainfall differences are not significant with six classical tests, nor is the difference between random and non-random controls. Analysis of isolated experimental clouds obtained on days of multiple cloud seeding produced significant findings. Results were stratified depending on whether the single clouds dissipated in the target area without merger or whether they merged with a neighbor. With the former stratification, the mean seeded rainfall exceeded the mean control rainfall by a factor of 2, a result that is consistent with earlier single cloud studies. No meaningful rainfall comparison was possible with the latter stratification because, on the average, the seeded clouds merged (and were dropped) 13 min earlier than the controls. This disparity in mean lifetimes before merger suggests that seeding is promoting merger in Florida Area Cumulus Experiments as intended. (Sims-ISWS)

the first of three papers describing and
ng field investigations, carried out from
1974, of winter clouds and precipitation in the Cascade Mountains of Washington State and their modification by artificial seeding. Airborne and ground observations of the natural clouds and precipitation were described here. It was observed that: (1) in pre-frontal conditions ice particles dominate over water droplets above the -10C level, but the ratio of ice to water is lower in post-frontal conditions; (2) the passage of an occluded or warm front causes a sharp lowering of the diffusional growth layers of the ice crystals, so that particles reaching the ground change from unrimed crystals which grow at low temperatures to rimed crystals which form a higher temperatures; (3) the maximum ice particle concentrations in the clouds are often several orders of magnitude greater than measurements of ice nuclei would suggest; (4) the growth of precipitation particles by riming and aggregation is particularly rapid in the last kilometer of fall; (5) snow particles reaching the ground originate 10 to 100 km upwind; and (6) on the western slopes of the Cascades the degree of riming and precipitation rates increase with increasing wind speed and water vapor content at 3 km, but this is not the case on the eastern slopes of the Cascades. **A NUMERICAL MODEL OF PRECIPITATION FROM SEEDED AND UNSEEDED COLD OROGRAPHIC CLOUDS,**
Denver Research Inst., Colo.
M. N. Plooster, and N. Fukuta.
Journal of Applied Meteorology, Vol 14, No 5, p 859-867, August 1975. 4 fig, 3 tab, 17 ref. Bureau of Reclamation 14-06-D-7048, NSF GI-39849.

Descriptors: *Weather modification, *Cloud seeding, *Model studies, *Mathematical models, Artificial precipitation, Cloud physics, Air circulation, Silver iodide, Nucleation, Computer models, Simulation analysis, Meteorology.
Identifiers: *Orographic clouds, Flow models, Cloud physics models, Seeding rates.

A numerical model of ice-phase precipitation from orographic clouds which includes the effects of seeding the artificial ice nuclei was described. The model described the events which take place when a layer of moist air of near-neutral stability, overlain by a more stable dry layer, flows over a mountain ridge. A two-dimensional, steady-state model of the flow in the vertical plane normal to the ridge furnished a field of the flow streamlines along which microphysical processes are followed. The cloud physics model described the formation of the supercooled cloud, the formation of ice particles from both natural and artificial ice nuclei, and the growth and precipitation of ice particles. Growth by both vapor deposition and riming were included. Artificial ice nuclei were released from a localized source at ground level. A simple Fickian diffusion process was used to describe the vertical transport of nuclei to the cold upper region of the cloud. The model calculated the rate of precipitation at ground level as a function of horizontal position. The dependence of precipitation efficiency on cloud top temperature was in good agreement with field observations from the Climax experiment. Substantial precipitation increases were produced by seeding clouds whose natural precipitation efficiences are low. However, it was shown that the seeding rate required to produce a given increase in precipitation rate is a strong function of cloud temperature. The model also showed that precipitation rates depend upon the activity of the ice nuclei as a function of temperature. (Sims-ISWS)

**TESTING OF CLOUD SEEDING MATERIALS AT THE CLOUD SIMULATION AND AERSOL LABORATORY, 1971-1973,**
Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
D. M. Garvey.
Journal of Applied Meteorology, Vol 14, No 5, p 883-890, August 1975. 9 fig, 2 tab, 3 ref. NSF GI-32894X2.

Descriptors: *Weather modification, *Cloud seeding, *Nucleation, *Testing, Evaluation, Testing procedures, Analytical techniques, Instrumentation, Research facilities, Crystals, Aerosols, Iodides, Silver iodide, Cloud physics, Meteorology.
Identifiers: *Cloud chambers, Ammonium iodide.

Developments in instrumentation at the Cloud Simulation and Aerosol Laboratory at Colorado State University since the Second International Workshop on Condensation and Ice Nuclei were outlined. Emphasis was given to improvements in the isothermal cloud chamber and the current status of a second-generation, controlled slow-expansion cloud chamber in which ascent of an air parcel may be simulated. Work with the aerosol dilution system (wind tunnel) was also described. Tests conducted during the three years 1971 through 1973 to determine the ice nucleus production of many currently used cloud-seeding devices were summarized. Effectiveness curves for nine ground-based steady-state generators burning various solutions of AgI-NH4I and AgI-NaI in acetone were presented. Test results for three airborne generators were also given and contrasted with the results for the ground generators. Finally, effectiveness values were presented for a number of pyrotechnics manufactured by Olin, Colspan, Sierra Research, and Naval Weapons Center. The need for caution in the use of such effectiveness curves in the design of weather modification experiments was stressed. It is believed that optimal 'dosages' of artificial nuclei for natural clouds can be determined using cloud chamber measurements. But probable differences in cloud characteristics and aerosol residence times both in cloud and in transit to cloud must be taken into account. Such considerations, together with a more accurate simulation of operational conditions of ventilation for different cloud-seeding devices, constitute a major thrust of current research effort at the Simulation Laboratory. (Sims-ISWS)

**AN EXPLANATION FOR THE UNUSUAL NUCLEATING ABILITY OF AEROSOLS PRODUCED FROM THE AGI-NH4I-ACETONE SYSTEM,**
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
B. L. Davis, L. R. Johnson, and F. J. Moeng.
Journal of Applied Meteorology, Vol 14, No 5, p 891-896, August 1975. 4 fig, 4 tab, 18 ref. NSF GI-34806.

Descriptors: *Nucleation, *Cloud seeding, *Weather modification, Silver iodide, Aerosols, Chemistry, Cystallography, Ice, Crystals, Ammonium compounds, Iodides, Laboratory tests, Meteorology.
Identifiers: *Ammonium iodide, Acetone.

The exceptional ice nucleating ability of aerosols obtained from combustion of AgI-NH4I-acetone solution is now well known. The high nucleating ability has been determined to come from the existence of a complex compound having a better epitaxial fit with respect to ice than has silver iodide. The compound has a stability region which includes the temperature interval of -20 to +9C at water saturation and has been observed to be present on AgI aersol particles produced from standard aircraft seeding generators in a wind tunnel dilution system. Its presence is presumed to occur as a result of incomplete destruction of the NH4(+) of the original solution. Although the unit cell of the phase is monoclinic, c-centered, it has a close packed structure nearly identical to silver iodide in the ao-bo crystallographic plane. In this plane the phase has a misfit with respect to the basal plane of ice of 1.3% at -7C as compared to 1.5% for silver iodide. The composition of the

phase is 3AgI-NH4I-6H2O but with 25% of the silver positions being vacant on the average. Compositions of 2:1 mole ratio AgI:NH4I can also exist in an apparent metastable state. The threshold of ice nucleation for the pure B sub n phase was found to be -1C as contrasted to the recognized -4C threshold for silver iodide. (Sims-ISWS)

**ANALYSIS OF RADAR OBSERVATIONS OF A RANDOMIZED CLOUD SEEDING EXPERIMENT,**
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
A. S. Dennis, A. Koscielski, D. E. Cain, J. H. Hirsch, and P. L. Smith, Jr.
Journal of Applied Meteorology, Vol 14, No 5, p 897-908, August 1975. 7 fig, 9 tab, 11 ref. Bureau of Reclamation 14-06-D-6796.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, Analytical techniques, Rainfall, Storms, Radar, Aircraft, Remote sensing, Silver iodide, Sodium chloride, Mathematical models, Correlation analysis, Regression analysis, Projects, Project planning, Meteorology.

Magnetic tape records for radar observations of 80 moving one-hour test cases in a three-way randomized (no-seed, salt, silver iodide) cloud seeding experiment have been analyzed in terms of echoing areas and radar-estimated rainfall amounts. Individual test cases ranged from nonprecipitating cumulus up to moderate thunderstorms with echoing areas exceeding 100 sq km and rainfall estimated at 3000 kT in 1 hour. Out of numerous predictor variables, cloud depth was found to be the best single predictor for both echoing area and radar-estimated rainfall. The echoing area and radar-estimated rainfall were very closely correlated. A cube-root transformation of the radar-estimated rainfall improved the correlation between cloud depth between cloud depth and the radar-estimated rainfall for the no-seed (control) sample to 0.91. For clouds of a given depth, both the echoing area and radar-estimated rainfall were larger in seeded than in unseeded cases. The differences between no-seed and salt cases were of marginal statistical significance, but the differences in echoing area and rainfall between no-seed and silver iodide cases were significant at the 1% level. The indicated effects, expressed as a percentage of the echoing area or radar-estimated rainfall in the no-seed cases, decreased with cloud depth. A comparison of no-seed and AgI cases with the aid of a one-dimensional steady-state cloud model showed that AgI seeding may have led to increases in maximum cloud height averaging 600 m. It was concluded that seeding affected the precipitation in the Cloud Catcher test cases through both the microphysical processes and the cloud dynamics. (Sims-ISWS)

**ON THE EFFECT OF NATURAL RAINFALL VARIABILITY AND MEASUREMENT ERRORS IN THE DETECTION OF SEEDING EFFECT,**
Battelle-Northwest, Richland, Wash.
A. R. Olsen, and W. L. Woodley.
Journal of Applied Meteorology, Vol 14, No 5, p 929-938, August 1975. 3 fig, 4 tab, 11 ref.

Descriptors: *Rinfall, *Variability, *Measurement, *Florida, Radar, Remote sensing, Rain gages, Cloud seeding, Weather modification, Precipitation(Atmospheric), Rain, Areal, Rain-fall disposition, Statistics, Meteorology.
Identifiers: *Measurement errors, Seeding effects.

Natural rain variability and measurment errors are obstacles to the determination of the seeding effect in convective cloud seeding experiments. The relative importance of these problems in Florida was evaluated. The major thrust of the work was embodied in a computer simulation of area cloud seeding experiments for two areas (570 sq km and 13,000 sq km) using field measurements as input. The effect of natural rain variability was studied as it related to the power functions of selected statistical tests for seeding effect. Measurement errors for gage and radar systems were introduced by modifying the underlying distribution of area mean rainfall. For the two Florida areas, natural rain variability is by far the major obstacle to the determination of a seeding effect. Errors are of lesser importance for the system of rain measurement used in Florida, which involves radar-rain estimates adjusted by gages. With a less accurate system of rain measurement, errors would assume greater relative importance. It was concluded that to detect a particular seeding effect with a minimum number of cases, the importance of natural rain variability must be decreased through either stratification of the experimental days or through meteorological predictors. The measurement system used by the Experimental Meteorology Laboratory is adequate for the evaluation of its seeding experiments and little will be gained through the expenditure of time and effort to improve it further. **THE EFFECT OF PERSISTENCE OF AGI ON RANDOMIZED WEATHER MODIFICATION EXPERIMENTS,**
Bureau of Reclamation, Denver, Colo.
D. Rottner, S. R. Brown, and O. H. Foehner.
Journal of Applied Meteorology, Vol 14, No 5, p 939-945, August 1975. 5 fig, 2 tab, 17 ref.

Descriptors: *Weather modification, *Cloud seeding, *Silver iodide, *Persistence, *Colorado, *New Mexico, Rainfall, Precipitation(Atmospheric), Ice, Nucleation, Statistics, Statistical methods, Evaluation, Aircraft, Rain gages, Atmosphere, Sounding, Mountains, Meteorology.
Identifiers: *Ice nuclei, Seeding effects.

The hypothesis was tested that AgI may persist for long periods of time and contaminate control experimental days when these control days immediately follow a seeded day. When the first 6-hour periods of all such potentially contaminated days were placed in the seeded population for two randomized weather modification experiments, the Colorado River Basin Pilot Project in the San Juan Mountains and the Jemez Atmospheric Water Resources Research Project, a statistically significant seeding effect was detected. When the first 6-hour periods were not included in either population a significant seeding effect was also detected. However, when the possibly contaminated periods were included in the control population, an inconclusive seeding effect was noted. Support for the hypothesis was obtained by making aircraft measurements of ice nuclei on days following seeded days in the San Juan experiment. Ice nuclei counts of 2 to 3 orders of magnitude above background were found under certain conditions. (Sims-ISWS)

**THE NATURE OF WINTER CLOUDS AND PRECIPITATION IN THE CASCADE MOUNTAINS AND THEIR MODIFICATION BY ARTIFICIAL SEEDING. PART III: CASE STUDIES OF THE EFFECTS OF SEEDING,**
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
P. V. Hobbs.
Journal of Applied Meteorology, Vol 14, No 5, p 819-858, August 1975. 50 fig, 10 tab, 11 ref. Bureau of the Reclamation 14-06-D-6999, NSF GI-17381, GI-31759.

Descriptors: *Weather modification, *Cloud seeding, *Washington, Sampling, Aircraft, Evaluation, Measurement, Mountains, Winter, Snow, Precipitation(Atmospheric), Artificial precipitation, Crystals, Rime, On-site data collections, Silver iodide, Nucleation, Cloud physics, Meteorology.
Identifiers: *Cascade Mountains, *Case studies.

Three case studies were described to evaluate the effects of artificial seeding from the air on cloud structure and snowfall on the ground in a small predetermined target area in the Cascade Mountains. On January 31, 1972, stratocumulus clouds just west of the Cascade crest were heavily seeded with silver iodide for 72 min. Airborne observations showed that the clouds were glaciated by the artificial seeding, new crystal types appeared, and there was an increase in convective activity. On the ground in the target area new snow crystal types appeared, riming decreased, freezing nuclei in the snowfall increased, and the snowfall rate decreased during the predicted period-of-effect (PPE) of seeding. Stratocumulus clouds over the Cascades were heavily seeded with silver iodide and dry ice for 77 min on January 19, 1973. Clouds, glaciated by the seeding, were tracked over the target area from the aircraft. A 2.5-fold and 10-fold increase in precipitation occurred in the target area at Snoqualmie Pass and Kachess Dam, respectively, during the PPE. At the same time the amounts of silver in the snowfall increased. Twenty-six cumulus clouds over the Cascades were seeded with silver iodide on March 27, 1973. There were sharp increases in the ice content of these clouds and snow fell from them over the target area during the PPE, causing snow showers at Snoqualmie Pass and Hyak. These detailed physical evaluations support preictions, based on observations of the natural clouds and precipitation and theoretical computations, that snowfall across the Cascade Mountains can be redistributed and increased by artificial seeding. **METHOD OF CLEANING AND STIMULATING A WATER WELL,**
J. D. Jenkins.
US Patent No 3,899,027, 3 p, 1 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 937, No 2, p 507, August 12, 1975.

Descriptors: *Patents, *Water wells, *Water supply, *Water yield improvement, Water reuse, Aquifers, Well casings, Impaired water use, Recirculated water, Chemicals, Water level, Recycling, *Cleaning.

A system is described for cleaning and benefitting of wells which relies on a recycling of the fluid from the well pump whereby the entire discharge from the pump is recycled through the well and surrounding aquifer along with selectively introduced solutions. The invention provides for precise amounts of chemical additives to be introduced with the concentrations being cycled through the well while being accurately controlled. This apparatus is mounted on the well without removing or in any way interfering with the pump apparatus or related equipment by extending a recycle line from the pump discharge to the well casing below the pump apparatus. The entire inner surface of the casing, as well as the inner and outer surfaces of the well column and the surrounding aquifer are subjected to the cleaning action. The free falling of the pump fluid back down the well casing impacts with the water standing in the lower portion of the casing and generates substantial shock wave energy which is transmitted to the surrounding aquifer, producing a cleaning action which stimulates the well and improves the yield. Descriptors: *Patents, *Water softening, *Water treatment, *Impaired water quality, *Water quality control, Filters, Ion exchange, Cleaning, Equipment, Recycling.
Identifiers: Backwash, Regeneration.

This invention provides an improved backwash system in water softeners which incorporates a scrubbing and cleaning action within a separate cleaning tube where the particles not only move along with the liquid flow which sets them in motion, but are specifically passed through the jet action flow of liquid so as to substantially enhance the cleaning action. In addition is the incorporation of a feeder for chemical additives also under the control of the flow inducing jet stream or liquid discharge. The apparatus includes an elongated cleaning tube fixed to the service tube along a substantial portion of its length within the filter bed. This cleaning tube is open at the top and bottom for a flow of the particulate filter material. The discharge end of a feed line connects with the cleaning tube below the upper intake end. A flap valve is so oriented as to, during the normal or water softening cycle, effectively seal the port and during the backwash operation arcuately flare open into the cleaning tube so as to provide a jet distribution of the liquid from the service tube diagonally across the cleaning tube covering the full cross-sectional area. The flow in the cleaning tube draws the filter material vertically downward in a circulating manner and actually passing directly through the jet flow of the cleaning liquid and being subjected to the action of the chemical additive. D. K. Lockhart.
US Patent No 3,896,625, 3 p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 936, No 5, p 1605, July 29, 1975.

Descriptors: *Patents, *Ocean waves, *Waves(Water), *Energy conversion, *Water level fluctuations, Water conveyance, Water storage, Pressure equipment.
Identifiers: Pressurized water.

An apparatus for utilizing the force of waves uses the tremendous inertia of falling water together with the constant rhythmic undulation effect of the surf to collect and pressurize water for subsequent release as a source of power. The collecting apparatus consists of a flexible pipe which includes funnels and check valves along its length. The funnels are held by flotation collars so that the faces of the funnel orifices are awash even in calm sea. The seaward end of the pipe is secured but with enough slack to provide movement with the undulation effect of the surf. The discharge end of the pipe empties into a reservoir where the water is pressurized and stored until it is used to drive a turbine, or the like. (Sinha-OEIS)

**ELECTRIC GENERATOR RESPONSIVE TO WAVES IN BODIES OF WATER,**
E. L. Schera, Jr.
U.S. Patent No 3,898,471, 3 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 937, No 1, p 292, August 5, 1975.

Descriptors: *Patents, *Waves(Water), *Ocean waves, *Energy conversion, *Energy transfer, Electric generators, Electric power generation, Floats.
Identifiers: Surface waves, Oscillation.

A generator is described which is responsive to surface waves, particularly in large bodies of water. The apparatus solves the problem of producing electric energy for various purposes, particularly flashing signals as an aid to navigation. In operation, this device is adapted to respond to normal surface waves on a base of water and is not intended to function with the action of ocean tides or other surface levels of bodies of water. The a justment of the float with respect to the level the water where waves normally occur is made slots and screws. When the float responds to su face waves, the generator will be operated in posite direction, which if a permanent magnet ternator is used, will generate a voltage when float is moved upward and downward. The volta is regulated by a solid state regulator. From the the electric current is carried to the lamp for safe illumination. Even small oscillation will gener enough electric power to illuminate the lamp to visible within a reasonable range. (Sinha-OEIS)

**SOLAR SEA THERMAL ENERGY.**
Hearing--Subcomm. on Energy--Comm. Science and Astronautics, U. S. House Representatives, 93d Cong, 2d Sess, May 23, 19 134 p, multiple fig, photo, ref

Descriptors: *Hydroelectric power, *Ocea *Heated water, *Electric power producti *Thermal power, Thermal water, Water temp ture, Hydrothermal studies, Solar radiation, E gy, Electric power, Electric generators, Elec powerplants, Electricity, Hydroelectric pla Electric power costs, Costs, Economics, Trop regions, Research and development
Identifiers: *Congressional hearings, *Solar powerplants, Energy crisis, Solar energy.

The topic of this subcommittee hearing was potentiality of extracting solar energy from ocean waters. Witnesses reported that it is p ble to harness ocean solar energy and to pro electric power at a cost competitive with fossil plants. The process of extracting electric po from the ocean involves the use of a standard heat engine which receives heat from the w upper layers of the tropical ocean, and then, extracting power, rejects the residual heat int deep cold water. Suggestion was made that sea power plants offer the opportunity of ob ing an inexhaustible source of low-cost ele power, free of thermal and atmospheric pollu and without the unsolved problem of radioa waste disposal. Witnesses presented detail garding construction, cost, and over-all feasi of solar sea powerplants. (Fernandez-Florida)

EMENTAL WATER USE IN THE EVER-
ES AGRICULTURAL AREA,
and Southern Florida Flood Control Dis-
est Palm Beach. Resources Planning Dept.
au.
cal Publication 74-4, June 1974. 46 p, 7 fig, 7
f, 1 append.

ptors: *Irrigation, *Water utilization,
ion practices, *Florida, Rainfall, Evapora-
vapotranspiration, Supplemental irrigation,
on permits, Runoff, Water policy,
ge(Water), Agriculture.
ers: *Lake Okeechobee, Everglades.

nentatl water use in a portion of the Ever-
Agricultural Area for the period 1961
1971 was examined. Only supplemental
use for the normal irrigation season,
per through May, was considered. Supple-
water was taken to be that water released
ake Okeechobee into the study area. The
l water was equated with applied irrigation
o meet crop growth requirements, although
ses for water released from the lake were
ledged and discussed. A comparison was
between monthly and seasonal water
into the study area and theoretical crop
ental water demand on a gross area-wide
lso examined, for the same period, were
ual volume of surplus water discharged
e study area to Lake Okeechobee. These
mpared with the annual volumes of water
l from the lake to meet supplemental water
nents. The investigation found that on a
ea-wide basis: (1) there is no significant
plication of supplemental water with
to beneficial use as represented by
cal crop requirements; (2) there is no ap-
waste of water from the Lake Okeechobee
ea system which, in effect, functions as a
system'; and (3) there has been no abuse of
tral and Southern Florida Flood Control
District's criteria established for the present water use permitting system. (Sims-ISWS)

**TRICKLE IRRIGATION SYSTEM,**
J. Rangel-Garza, and J. Leal-Diaz.
U.S. Patent No 3,897,009, 4 p, 14 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 936, No 5, p 1735, July 29, 1975.

Descriptors: *Patents, *Irrigation systems, *Surface irrigation, Irrigation practices, Irrigation operation and maintenance, Irrigation efficiency, Fertilizers, Fungicides, Insecticides.
Identifiers: *Trickle irrigation systems.

The irrigation system consists of hoses and flexible or rigid pipes to which at different intervals, depending on the needs, will be connected tricklers or when necessary secondary lines will be connected to main lines by a reduction T connector. In the branch pipes are tricklers having two part female and male interfitting members. Grooves on the male member engage the inner female surface to provide water flow channels on the inner circumference of the central pipe bore to reuce pressure. These tricklers are coupled in line in a pipe or hose and have structure for locking the parts together and preventing entry of dirt. (Sinha-OEIS)

**EMITTER FOR IRRIGATION SYSTEMS,**
Harmony Emitter Co., Inc., Tucson, Ariz. (assignee).
R. C. Harmony.
US Patent No 3,899,136, 4 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 937, No 2, p 542, August 12, 1975.

Descriptors: *Patents, *Irrigation, *Irrigation efficiency, Surface irrigation, Irrigation operation and maintenance, Water distribution(Applied), Water pressure, Equipment.
Identifiers: Emitters.

An emitter is described which delivers a constant flow of water despite variations in water pressure and is non-clogging, self regulating and self flushing. The emitter having a water discharge outlet and connected to a source of water under pressure for irrigating soil comprises; a pair of imperforate flexible sheets coterminous with one another and defining both the water discharge passageway for a flow of water through the emitter and the water discharge outlet; tranverse ribs within the central part of adjacent surfaces of each of the flexible sheets for establishing a water pressure gradient through the passageway; and pressure means for biasing the pair of sheets toward one another to regulate the lateral expansion of the passageway. The pressure means is responsive and variable in proportion to the water pressure at the source. Therefore the flow of water through the emitter is regulated at a constant rate. (Sinha-OEIS)
W75-12303

**IRRIGATION SYSTEM,**
J. R. Gross.
US Patent No 3,901,447, 4 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 937, No 4, p 1310, August 26, 1975.

Descriptors: *Patents, *Irrigation systems, *Mist irrigation, *Sprays, *Temperature control, Frost protection, Heat exchangers, Distribution systems, Citrus fruits.

An irrigation system is described which includes a pressurized source of water, a number of distribution conduits connected with the source of water and equipped with uniformly spaced spray heads for emitting temperature-controlling bodies of mist. Such a system can be employed in reducing temperatures but more frequently can elevate the temperature in order to avoid frost damage. The invention comprises a continuous-flow heat exchanger including a fire-box of tubular configuration. A water jacket surrounds the fire box in which the stream of water is conducted concentrically around the external surface of the fire box. A pressure burner is adapted to project a pressurized stream of heated gases axially through the tubular fire box in a direction opposite to the direction in which the stream of water is conducted. (Sinha-OEIS)
W75-12309

**IRRIGATION SYSTEM EMITTERS WITH RENEWABLE FILTERS,**
B. P. Babin.
US Patent No 3,901,448, 5 p, 29 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 937, No 4, p 1310-1311, August 26, 1975.

Descriptors: *Patents, *Irrigation systems, *Irrigation practices, *Filters, Flow control.
Identifiers: *Drip irrigation, Emitters, Soil moistening.

The invention relates to irrigation assemblies for use in long run irrigation systems. The emitters are particularly adapted for use in such systems in that a positive slow discharge of water is assured under varying water pressure conditions. The incorporation in the emitters of filters or filtering elements which, in addition to assisting to the regulation of the discharge flow, perform a significant function in eliminating ingress of aperture clogging soil particles while at the same time trapping such contaminants as might be contained in the irrigating fluid itself. The method of mounting or securing the filters is specifically devised so as to enable periodic filter replacements. The emitter assemblies include or are associated with a discharge opening in the fluid carrying tube with the assembly including an aperture overlying filter or filter element and a retainer devised in a manner so as to secure the filter in position and allow for a discharge of fluid at a slow or drip rate. The retainer will normally incorporate a substantially rigid filter overlying cover defining a chamber for

the reception of the filter and includes fluid discharge passages. The cover in turn is affixed to the tube by appropriate securing means engaged between the cover and the tube. (Sinha-OEIS)

PHOSPHORUS METABOLISM AND RESPRIRATION IN WHEAT LEAVES AND ROOTS IN THE CASE OF WATER DEFIENCY, (IN RUSSIAN),
Vsesoyuznyi Institut Rastenievodstva, Leningrad (USSR).
T. A. Rychkova.
S-Kh Biol, Vol 8, No 2, p 247-249, 1973.

Descriptors: *Phosphorus, *Metabolism, *Respiration, *Wheat, Leaves, Roots, Energy, Acids, Lipids.
Identifiers: Nucleic-acid, Nucleotides.

A study of the effect of slight dehydration on P metabolism and respiration of wheat leaves and roots showed that, in the case of a soil water deficiency during the critical period between the start of shooting and start of heading, nucleic acid metabolism was intensified in the leaves of the upper layer and the content of free nucleotides and lipid P increased. A higher level of respiration corresponded to increased P metabolism, on the basis of which it is possible to determine an intensification of energy metabolism in plants in the presence of a slight water deficit.--Copyright 1974, Biological Abstracts, Inc.

# 4. WATER QUANTITY MANAGEMENT AND CONTROL

FLOOD PLAIN INFORMATION: SPRING AND WILLOW CREEKS, HOUSTON METROPOLITAN AREA, TEXAS.
Army Engineer District, Galveston, Tex.
Prepared for Harris Soil and Water Conservation District, Houston, Texas, June, 1972. 38 p, 8 fig, 26 plates, 6 tab.

Descriptors: *Flood control, *Flood data, River basin development, *Flood plain zoning, Floods, *Regional flood, *Flood profiles, Flood discharge, Flood frequency, Flood plains, Flooding, Flood proofing, *Texas.
Identifiers: Intermediate Regional Flood, Standard Project Flood, Spring Creek(Tex), Willow Creek(Tex), *Houston(Tex).

Spring Creek flows 68 miles from west to east along the northern border of Harris County, Texas, 30 minutes commuting time north of downtown Houston. Spring Creek and its major tributary, Willow Creek, drain an area of 760 square miles of increasingly urbanized land. Numerous incorporated and unincorporated communities have developed along their flood plains with extensive residential, commercial, and industrial development. Stream gage records show that the area is subject to frequent summer floods which last several days due to the flat slopes and small channel capacities of the creeks. Thirty-four bridges cross the creeks in the reaches studied. Flood water backs up behind them if trees and other debris collect there and may push a sudden wall of debris and water loose to rush downstream. Millions of dollars of damage were caused by the record May 1929 flood with its discharge of 48,300 cfs. The Intermediate Regional Flood and Standard Project Flood expected in these creeks would be much more severe with discharges of 101,000 cfs and 143,900 cfs respectively. Definitive data is provided for the best planning of the endangered area, although land subsidence due to oil and water withdrawal may somewhat alter the exact flood area boundaries. The situation could be changed by channel improvements, removal of obstructions, or non-structural alternatives including zoning and subdivision regulations. (Herr-North Carolina)

DRAINING TELFORD NEW TOWN.
Surveyor, Vol. 141, No. 4218, p 49, April 13, 1973. 1 fig.

Descriptors: *Drainage area, *Sewers, *Sewerage, Land reclamation, Tunnels, Siphons, Reservoirs, Construction, Waste water treatment
Identifiers: England, River Severn, River Tern.

The original area of approximately 9000 acres for Telford New Town drains to the River Severn in England with the new drainage area of about 10,000 acres flowing to the River Tern, a tributary of the Severn. At the time the designated area was expanded, long lengths of the sewers in the southern area had been constructed with no allowance being made for future development in surrounding sections of the catchment area. The effect of extending the boundary of the new town was to introduce new areas for development within the southern catchment region. It was found possible to alter the proposed sewer network and to introduce an extra balancing reservoir in such a way that flows in the sewers already constructed would not exceed the designed capacity. Two contracts were let for this work: the first, for sewers and land reclamation work; and the second, for sewers in tunnel and open cut and the construction of a siphon draw-off from the balancing reservoir. The Randlay/Hollinswood sewers, used in the projects, will provide drainage for additional areas and will provide the link to divert flows through the extra balancing reservoir. (Sandoski-FIRL)

SEATTLE PROJECT CALLS FOR ROCK WEIRS.
Western City, Vol. 49, No. 4, p16, 19, April, 1973. 1 fig.

Descriptors: *Flood control, *Environmental effects, *weirs, Streams, Geology, Biology, Environmental engineering.
Identifiers: *Environmental Impact Statements, *Rock weir.

An environmental impact statement has been prepared by a project planning and engineering consultant to the Seattle Department of Engineering. Now under construction, the project to collect flood water from 210-acres in the North Greenwood section of the city and channel it into Piper Creek at Carkeek City Park, which flows into Puget Sound, will cost approximately two million dollars. The study took much less staff time than was initially felt necessary and was completed under the direction of 2 landscape architect assisted by several hydraulics engineers. Also contributing were a biologist and an environmental geologist, who aided by conducting an environmental inventory and analysis encompassing geological history of the creek area, superficial and bedrock geology, groundwater, stream economics, water chemistry, aquatic biology, and terrestrial biology. FLOOD PROFILES IN THE UMPQUA RIV BASIN, OREGON: PART 3, UMPQUA RIV BELOW SCOTTBURG, SCHOLFIELD, C CREEK ABOVE GLENDALE,
Geological Survey, Portland, Oreg.
E. A. Oster.
Open-File report, 1975. 108 p, 88 fig, 7 tab, 6 re

Descriptors: *Flood profiles, *Flood frequer *Hydrologic data, *Streamflow, *Oregon, Fl data, Flow rates, Peak discharge, Hydrogra Analytical techniques, Tidal streams.
Identifiers: *Umpqua River basin(Oreg).

This the third and final report in a series to c approximately 300 miles of Umpqua River b streams in Oregon. The study was made at request of Douglas County Planning Commis to compute profiles for the 10-, 25-, 100-, and

floods and the December 1964 flood. The
es covered in this report are: Umpqua River
Gardiner upstream to Scottsburg, Smith
from the mouth to Sulphur Springs, Schol-
Creek from the mouth to Wind Creek, and
Cow Creek from below Glendale upstream
ow Creek, near Anchor. The flood-frequency
needed to determine project discharges were
uted by the log-Pearson Type III method,
annual peak-flow data for Cow Creek and
Umpqua River. A regional analysis by the
s of Engineers (1969) was used for the Smith
and Scholfield Creek. The frequency curves
are shown. The highest annual flows of the
qua River usually occur from November
gh March as a result of heavy winter rains
ented by snowmelt; some annual floods have
red as late as mid-April, primarily caused by
melt from the high mountains of the Cascade
e. Flood discharges on the Smith River and
field Creek reflect the direct influence of
al storm patterns, which may not penetrate
ough inland to cause Umpqua River flood. In
wer estuary area, extreme high tides and
onshore wind increase flood levels above
caused by high river discharges along.

e, Ammonium chloride, Barium chloride,
tetraborate, Sodium arsenite, Mercuric
e, Lead nitrate, Zinc sulfate, Synergistic ef-
Antagonistic effects.

ement of Eurasian watermilfoil
phyllum spicatum) in the Tennessee Valley
hed involves water level fluctuation and
dal treatment with 2,4-D. Possible addition

of chemicals to make 2,4-D treatment more effective and economical was tested by measuring growth of watermilfoil under laboratory conditions with sublethal levels of 2,4-D and partially inhibitory concentrations of aluminum chloride, ammonium chloride, sodium arsenite, barium chloride, sodium tetraborate, copper sulfate, mercuric chloride, lead nitrate, sodium chloride, and zinc sulfate. Barium chloride, lead nitrate, and zinc sulfate were additive in effect with 2,4-D. Other compounds produced synergism at some concentrations and mutual antagonism at others. Effectiveness of 2,4-D was increased more by mercuric chloride, aluminum chloride, sodium chloride, and sodium arsenite than by copper sulfate. The greatest synergism was observed with mercuric chloride (0.2 micromoles), aluminum chloride (10.0 micromoles), and sodium chloride (200 millimoles). Maximum synergism for sodium arsenite with 2,4-D was at a level slightly above the criterion for potable water. Lower arsenic concentrations and higher 2,4-D concentrations should be explored. The sodium chloride concentration necessary for effective interaction with 2,4-D is too high to be useful but indicates erratic results obtained in estuaries subject to salinity fluctuations may be due to the sodium chloride concentration. Identifiers: *Alberta.

Effective land use and land management policies are based ideally on data collected from land classification and land evaluation procedures. This paper describes a method employed in classifying and evaluating land for the production of lodgepole pine (Pinus contorta var. latifolia) in the Hinton-Edson area of Alberta (Canada). Initially, a soil survey was conducted in the area. Productivity of various collections of soils was then obtained by statistically comparing soil information derived from the soils map with forest growth information obtained from the continuous forest inventory program of North Western Pulp and Power Limited of Hinton. Results indicate that aspect has minimal effect on pine productivity except for sandy and gravelly soils. General differences in growth were related to soil parent material, climate, drainage, and physiography, and more specific differences were attributed to soil subgroup, soil series, soil reaction, and percent slope. It was relized that pine growth is a function of pedological, landform, and climatological factors, and all must be considered when evaluating productivity.--Copyright 1974, Biological Abstracts, Inc.

flooding, Hydrologic analysis, Frequency analysis, *Sabino Canyon(Ariz), Hydrologic events.

Two commonly used methods of hydrologic analyses are parametric reconstruction and development of frequency distributions. Both techniques can be used to develop estimates of potential of damaging flash floods. However, under conditions of limited data, many areas may not have experienced enough flash floods to be recognized as prone to flash flooding. This paper gives a method to infer expected severity for flooding based on frequency analysis, which does not require a complete spectrum of data over a given basin. This method was used to estimate potential peak flows on Sabino Canyon, Arizona, and probability of occurrence of specified magnitudes was analyzed. These estimates indicate a strong possibility of damaging flash floods occurring in areas where none have occurred in several decades. (NOAA)

Identifiers: *Congressional hearings, Environmental policy, Navigation obstructions.

Hearings were held before the House Subcommittee on Water Resources of the Committee on Public Works to consider legislation that would permit the diversion and withdrawal of additional water from Lake Michigan into the Illinois Waterway, and for various other purposes. Testimony was given by numerous federal, states, and local officials. The purpose of the water diversion is to alleviate the tremendous human and economic hardships caused by current high waters throughout the Great Lakes. Concern was expressed over preservation of the Lake Michigan shoreline as well as prevention of flood damage. It was felt that the proposed measures would be desirable from esthetic and public health viewpoints. The possibility of such disadvantages as downstream flooding and adverse effects on navigation were mentioned. The general consensus, however, was that the disadvantages could be overcome through careful control of the diversion. (Fernandez-Florida)

Urban drainage, Storm water, Storm drai
Storage tanks, Infiltration, Rainfall, Methodolo
Identifiers: Weeping tile drainage.

The installation of weeping tiles for residen
property drainage has presented several possi
ties of what to do with the collected water incl
ing: connection to sanitary sewer; connectio
storm sewer; proper grading with runoff a
from the house; storage of excess wet weat
flow; overflow treatment; and, diversion of r
leader. The proper choice of disposal method
pends on the flow quantities per subdivisio
calculational method is presented for determi
these quantities based on Darcy's Law and
continuity equation. Requirements for using
calculational procedure are: knowledge of
physiography and soil conditions of the a
proper perspective in the judgement of the hyd
lic situation; and, knowledge of the technique u
in laying the weeping tile. Parameters involve
the estimation of weeping tile flow quantities
infiltration, the initial process of water seep
through dry or drained soil to reach the w
table; weeping tile drainage, the quantity flo
through the drain as a function of the average r
fall intensity; and, time required for drainage a
precipitation ceases. A sample calculation
weeping tile flow is presented for a typical h
and surrounding property using experimental
obtained from a house in Niagara Falls, Can

ne tidal flood situation of Poquoson, Virginia, at e eastern tip of York County, situated on the estern shore of Chesapeake Bay between the lal Poquoson and Back Rivers, is presented to lp local officials solve flooding problems and isely use land subject to flooding. Records of lal flood experience have been developed using lal records of the nearby areas, interviews and storical documents. Greatest floods occurred in 33 and 1962, caused by Chesapeake Bay waters iven by a hurricane and a northeast storm, spectively. Standard Project Tidal Flood deterination indicates tide heights as high as elevation .0 are possible and Intermediate Regional Tidal ood heights between elevations 8.0 and 9.0 can expected about once per 100 years. Resulting od damage would be substantial due to the great tent and depth of flooding, since most of oquoson is below elevation 7.0 msl datum. Many uses, roads and streets would become inunted. Main flood season due to hurricane extends m May to November. Water velocity varies dely from a few feet per second for tidal curnts up to 25 feet per second (17 miles per hour) r wind-driven waves. Flooding caused by hurcanes is of shorter duration than that caused by rtheasterns (cyclones). A year seldom passes thout storms severe enough to cause flooding. minimize flood damage, Poquoson should conol flood plain development through zoning and bdivision regulations and construct flood proction works. (Grden-North Carolina)

entifiers: *Meherrin River(Va), Emporia(Va), termediate Regional Flood, Standard Project ood.

raining a long, narrow area of about 749 sq mi, cluding the city of Emporia, a farm market nter, the Meherrin River is subject to flooding used by storms over the entire area lasting 2 to 3 ys. The average rainfall is about 45 inches on the atershed above Emporia. The flood plain inudes residential and commercial development. ne small reservoir owned by Virginia Electric d Power Company has no significant effect on oods due to the small volume of available orage. A county regulation forbides subdivision land subject to flooding for residential use. veral flood reducing proposals including flood oofing, zoning regulations, building codes, alrnate uses of flood plain, and control of filling on od plain are suggested. The greatest flood ocrred in August 1940 with a peak discharge of ,000 cfs. Most recent flood was January 9, 1962 th a discharge of 12,900 cfs. A 50-year flood ould have an estimated peak discharge of 23,000 s, considerably below the 1940 flood, while a andard Project Flood's estimated peak scharge would be 40,000 cfs, about 2 feet higher than the 1940 flood. The purpose of this report is to make people aware of the possibility of flooding and to suggest measures to limit flood damage. (Salzman-North Carolina)
W75-12368

**FLOOD PLAIN INFORMATION, WILLAMETTE RIVER, JOHNSON, KELLOGG AND MT. SCOTT CREEKS, MILWAUKIE-OAK GROVE-LAKE OSWEGO, OREGON.**
Army Engineer District, Portland, Oreg.
Prepared for Clackamas County, Oregon, May 1970. 55 p, 6 fig, 24 plates, 17 tab.

Descriptors: *Floods, *Flooding, *Flood plains, Flood control, Flood protection, Reservoirs, Historic floods, *Oregon, *Flood forecasting.
Identifiers: *Willamette River(Ore), Johnson Creek(Ore), Kellogg Creek(Ore), Mt. Scott Creek(Ore), Milwaukie(Ore), Oak Grove(Ore), Lake Oswego(Ore), Intermediate Regional Flood, Standard Project Flood.

Located just south of Portland, Oregon, on the east bank of Willamette River, Milwaukie and Oak Grove are inundated by flood waters of its tributaries, Johnson Creek and Kellogg Creek respectively. The town of Lake Oswego fronts on the west bank of the Willamette River. Principal residential, commercial and industrial developments lie on these flood plains. Main flood season is winter or spring, depending upon principal source of runoff and the water surface elevations on Columbia River. Heavy rain augmented by snowmelt and intense rainfall cause flooding. Floods last from 1 to 5 days on the creeks, 7 to 14 days on the river. No authorized or proposed flood control measures for Kellogg Creek or its major tributary, Mt. Scott Creek, exist. An authorized channel improvement project for Johnson Creek has not been implemented. Eleven upstream multiple purpose reservoirs on Willamette River operate for flood control. No flood plain regulations are in effect. Greatest known flood occurred in December 1861 on Willamette River and in December 1964 on Johnson, Kellogg and Mt. Scott Creeks. An Intermediate Regional Flood would be 4 ft lower than the December 1964 flood while a Standard Project Flood would be from 2 to 5 ft higher than the December 1964 flood. Flood damage from any major flood would be substantial. This report provides a basis for further study and planning by local governing bodies. (Salzman-North Carolina)
W75-12369

**FLOOD PLAIN INFORMATION: HASSAYAMPA RIVER, VICINITY OF WICKENBURG, ARIZONA.**
Army Engineer District, Los Angeles, Calif.
Prepared for Flood Control District of Maricopa County, Arizona, April, 1972. 27 p, 13 fig, 23 plates, 6 tab.

Descriptors: *Floods, *Flooding, *Flood profiles, *Historic floods, *Erosion, Flash flood, Flood flow, Flood forecasting, Flood data, Flow duration, Deposition(Sediments), *Arizona.
Identifiers: *Hassayampa River(Ariz), Wickenburg(Ariz), Intermediate Regional Flood(IRF), Standard Project Flood.

Originating in the Bradshaw Mountains south of Prescott, the Hassayampa River drains a study area ranging from approximately 1830 ft to 7700 ft above mean sea level. Northern third of the basin is heavily forested mountains, central third is rolling hills, southern third is desert valley. Upstream gradient is about 400 ft/mi; gradient is 20 ft/mi near the downstream study limit. In Wickenburg, a retirement and dude ranch center 50 miles northwest of Phoenix, development in the flood plain includes a sewage treatment plant, a high school, apartments, public utilities and a private airstrip. Since little flat land is available elsewhere pressure for expanding flood plain development is anticipated. In this arid, sub-tropical climate zone of infrequent rainfall, flash floods occur in late summer and early fall from general storms and severe thunderstorms. In 1890 one of the worst flood disasters in the U.S. in terms of loss of life happened when a dam under construction failed killing 76 persons. In 1970 intense rainfall from Hurricane Norma created a major flood causing severe damage to property including the sewage disposal system which created a health hazard. No lives were lost. An Intermediate Regional Flood (IRF) would have a peak discharge at Box Canyon (location of a USGS stream gage) of 77,000 cfs as compared to 58,000 cfs for 1970 flood. Channel velocity will range from 6-20 ft/sec with 1-10 ft/sec overbank flow in flood plain areas. During a Standard Project Flood expected peak discharge would be 140,000 cfs with channel velocities 1 to 5 feet greater than an IRF causing severe erosion plus deposits of silt and debris. An irrigation control dam in Box Canyon proposed in 1945 has not been built. (Hufschmidt-North Carolina)

**FLOOD PLAIN INFORMATION: ONION CREEK, AUSTIN, TEXAS.**
Turner, Collie and Braden, Inc., Houston, Tex.; and Army Engineer District, Galveston, Tex.
Prepared for the City of Austin, June, 1973. 38 p, 6 fig, 15 plates, 6 tab.

Descriptors: *Floods, *Flood plains, *Flood control, *Flood protection, *Flood plain zoning, Land use, Flood recurrence interval, Flood damage, Flow characteristics, *Texas, Historic floods, Flood forecasting, Nonstructural alternatives.
Identifiers: *Austin(Tex), *Onion Creek(Tex), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

This examination of past floods and estimation of future floods on 21 miles of Onion Creek near Austin, Texas, was requested as the basis for a flood plain zoning ordinance. Past floods have not done significant damage due to the agricultural use of the land bordering Onion Creek, which slopes about 8 ft/mi with cypress, oak and mesquite in the wooded portions of the flood plain. Pressure has been exerted to encroach on the flood plain with residential developments to accommodate the needs of Austin's anticipated growth of up to 100,000 people by 1983. Part of the City of Austin sewage treatment plant is located in the flood plain and a state park and municipal golf course are proposed. Located within a hydrologic province in the path of tropical and semitropical storms, Onion Creek can experience some of the highest rainfall in the U. S. Because of the creek's narrow valley, flooding does not extend to wide areas but water velocity is high and presents potential damage to structure in the flood path. The major flood of record occurred in September, 1921 with a discharge of 138,000 cfs, almost twice that of subsequent floods. An Intermediate Regional Flood would discharge 83,700 cfs and a Standard Project Flood would have a peak discharge of 162,000 cfs. Eleven bridges span the creek and at six of them the bridge floor is lower than the IRF crest elevation which could cause transportation and evacuation problems if not actual damage to bridges. The report recommends use of nonstructural alternatives including flood plain zoning, subdivision

regulations, building codes, health regulations, and development policies to protect against the hazards of floods on Onion Creek. (Park-North Carolina)
W75-12374

**FLOOD PLAIN INFORMATION: JAMES RIVER, HOWARDSVILLE TO SCOTTSVILLE, ALBEMARLE COUNTY, VIRGINIA.**
Army Engineer District, Norfolk, Va.
Prepared for the Albemarle County Board of Supervisors, November, 1973. 26 p, 17 fig, 13 plates, 5 tab.

Descriptors: *Floods, *Flooding, *Flood forecasting, *Flood profiles, Flood protection, Flood control, Flood plains, Historic floods, *Virginia.
Identifiers: *James River(Va), Howardsville(Va), Scottsville(Va), Albemarle County(Va), Totier Creek(Va), Intermediate Regional Flood, Standard Project Flood.

The 11-mile portion of the James River Basin covered in this report is located on the Piedmont Plateau approximately 200 miles above the river's mouth. The river channel slopes at 2.7 feet per mile and is relatively free of vegetation. Varying from 200 to 2500 feet in width, the flood plain is open and in agricultural use. The only development consists of several business and industrial establishments in the town of Scottsville. A stream gaging station at Scottsville shows that floods are produced by intense rainfall during all seasons but most notable are the hurricane produced floods. Flood stages last for several days due to the size of the drainage area (4,584 square miles). Although an advisory flood protection and management study has been made, no flood damage reduction measures presently exist. An earthfill dam on the Totier Creek tributary has no flood control capacity. The greatest flood occurred on June 22, 1972 as a result of intense rainfall associated with Hurricane Agnes. The river crested at 34.02 feet and had a peak discharge of 301,000 cubic feet per second (cfs). The most recent flood on October 6, 1972 crested at 23.24 feet and had a peak discharge of 97,600 cfs. An Intermediate Regional Flood and Standard Project Flood would inundate the flood plain with peak discharges of 237,000 cfs and 445,000 cfs, respectively. Damage exceeding the $4 million total inflicted by Hurricane Agnes can be expected unless control measures are taken. (Salzman-North Carolina)
W75-12375

**FLOOD PLAIN INFORMATION: SOUTH SANTIAM RIVER, LEBANON, OREGON.**
Army Engineer District, Portland, Oreg.
Prepared for Linn County, Oregon, June, 1973. 30 p, 14 fig, 19 plates, 5 tab.

Descriptors: Floods, *Flood control, *Flood protection, *Water storage, *Flood forecasting, *Flood profiles, Flooding, Flood plain, Flood plain zoning, Reservoirs, *Oregon.
Identifiers: *South Santiam River(Ore), Lebanon(Ore), Intermediate Regional Flood, Standard Project Flood.

South Santiam River, a tributary of the Willamette River, drains 1,037 square miles in central northwestern Oregon. Slope varies from 8 ft/mi upstream to 3 ft/mi downstream. Most of the flood plain in the 22-mile study area is devoted to agriculture. Lebanon (population 6,372) is on the flood plain where South Santiam River emerges from the foothills. Flood season extends from October through April with larger floods in December and January resulting from intense rainfall augmented by snowmelt when the soil is saturated or frozen. The river remains above bankfull stage for 6 to 8 days during floods. Natural and manmade obstructions, including 4 bridges, impede flood flow. Two flood control storage projects regulate runoff for about 75% of the drainage area. Over 20 bank protection projects have been constructed under emergency flood control authorization and channel debris removed. A comprehensive land-use plan makes provisions for county implemented flood plain regulations. Largest known flood occurred in December 1861. The December 1964 flood, the largest since stream flow records have been kept, crested 24.5 feet above bankfull and discharged 95,200 cfs. An Intermediate Regional Flood (IRF) would have discharged 98,000 cfs under natural conditions. With upstream storage provided by Foster and Green Peter Projects, an IRF would discharge 46,500 cfs and Standard Project Flood would discharge 92,000 cfs. (Salzman-North Carolina)
W75-12376

**SPECIAL FLOOD HAZARD INFORMATION: ISSAQUAH AND TIBBETTS CREEKS, ISSAQUAH AND VICINITY, WASHINGTON.**
Army Engineer District, Seattle Wash.
Prepared for the City of Issaquah and King County, Washington, June, 1971. 8 p, 14 plates.

Descriptors: *Flood plains, *Planning, *Flood plain zoning, Flood damage, Land use, Obstructions to flow, Flood profiles, Flood data, Floodways, *Washington, Erosion.
Identifiers: *Issaquah Creek(Wash), *Tibbetts Creek(Wash), Issaquah(Wash), Flood plain management, Intermediate Regional Flood, Lake Sammamish(Wash), Cascade Range, Issaquah County(Wash), King County(Wash).

Extending upstream from Lake Sammamish, Issaquah Creek, its North and East Forks, and Tibbetts Creek drain 59 square miles of the forested foothills of the Cascade Range in Washington. Creek channels are well defined and overgrown with brush. Major flood season extends from October until March. Greatest flooding is caused by rainstorms although melting snow occasionally augments flooding. Brush and materials placed to stabilize creek banks reduce channel capacity and will increase flood depths on adjacent lands. The maximum flood flow at the gage on the Issaquah Creek near the mouth occurred January 5, 1969 and was 1960 cfs. At the same location, an Intermediate Regional Flood (IRF) would have a peak discharge of 4750 cfs and a channel velocity of 15 feet per second, fast enough to create erosion problems. Flood occurrences greater than an IRF were not investigated. Most of the flood prone areas are still undeveloped. The greatest development of the flood plain is at the city of Issaquah which is primarily residential. Thirty-seven bridges cross the creeks, creating potential obstructions to flow. The report recommends that the local governments consider land use zoning measures and the establishment of a floodway to minimize flood damages. (Diefendorf-North Carolina)
W75-12377

**SPECIAL FLOOD HAZARD INFORMATION: PARADISE CREEK, PULLMAN AND VICINITY, WASHINGTON.**
Army Engineer District, Walla Walla, Wash.
Prepared for Whitman County, Washington, January 1970. 10 p, 10 plates, 3 fig, 1 tab.

Descriptors: *Flood plains, *Flood damage, *Planning, *Flood profiles, Land use, Flood data, Obstruction to flow, Flood plain zoning, *Washington, Idaho.
Identifiers: *Paradise Creek(Wash), *Pullman(Wash), Whitman County(Wash), Flood plain management, Standard Project Flood, Intermediate Regional Flood.

Throughout the 6.8 mile study reach of Paradise Creek east of Pullman, Washington, the flood plain is quite narrow, the average stream slope is 25 ft/mi, channel depth averages 6 feet, and mean basin elevation is 2700 ft above sea level. Major floods occurred in March, 1910, and February, 1948, but details on these floods are lacking. Peak flow of future planning floods was determined from meteorological and climatological records and gage data from nearby streams. At the mouth of Paradise Creek in Pullman the discharge of an Intermediate Regional Flood (IRF) would be 2400 cfs. Peak discharge for the Standard Project Flood (SPF) would be 3700 cfs at the mouth. Floods on Paradise Creek are of short duration, usually less than one day. Velocities in the creek channel range up to 18 feet per second. Velocities up to 6 feet per second can occur in the overbank area; velocities over 3 feet per second are considered hazardous. There are 27 bridges within the study reach, some severely restricting flow. They could sustain considerable damage in an IRF or SPF. Flood plain developments include residential and commercial establishments; however, most of the land is used for grazing. Flood plain regulations by the city of Pullman and Whitman County are needed as increasing development is expected along the Creek. (Diefendorf-North Carolina)

**FLOOD PLAIN INFORMATION: HACKBERRY CREEK AND COTTONWOOD BRANCH, DALLAS COUNTY, TEXAS.**
Army Engineer District, Fort Worth, Tex.
Prepared for Dallas County, Texas, December, 1974. 33 p, 7 fig, 11 plates, 5 tab.

Descriptors: *Floods, *Flood plains, *Flood profile, *Flood forecasting, *Flooding, *Flood plain zoning, Obstructions to flow, Maximum probable flood, *Texas.
Identifiers: Irving(Tex), *Hackberry Creek(Tex), Cottonwood Branch(Tex), Dallas County(Tex), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

The watershed of Hackberry Creek in northwest Dallas County, Texas, has a drainage area of 20.0 square miles primarily rural in nature but with growing development pressures from Irving, 'The Fastest Growing City in Texas.' (From 1950 to 1970 Irving's population grew from 2,621 to 97,260). The Dallas-Ft. Worth Regional Airport is located in the upper portion of the drainage basin and is certain to spur continued growth. Although no records have been kept on flood characteristics of Hackberry Creek and Cottonwood Branch, a major tributary, future flood predictions were based on flood data for neighboring streams and on precipitation data. The Intermediate Regional Flood (IRF) on Hackberry Creek above the confluence with the South Fork of Hackberry Creek would have a peak discharge of 16,200 cfs, a height of rise above bankfull stage of 9.3 feet, and an overbank velocity of 2.8 feet/second while the corresponding figures for a Standard Project Flood (SPF) would be 25,300 cfs, 11.6 feet, and 3.0 feet/second. Accompanying plates show areas subject to flooding by the SPF and IRF. The report recommends investigation and implementation of flood plain zoning ordinances, subdivision regulations, building and health codes, and several other non-regulatory measures to reduce damages. entifiers: Collier County(Fla), Everglades, oridan aquifer. Tamiami Aquifer, Miocene age.

uthwestern Collier County, Florida is undergo-growth in population with consequent in-eases in their water demand. Although rainfall is ndant, losses due to evapotranspiration and anic discharge are equally large. The subsur-e geology of the two main aquifers underlying area is discussed. Well logs, drillers logs are main tool for understanding the subsurface ology of this low, poorly-drained, flat plain. The llowest aquifer is composed entirely of perme-e limestones in the Tamiami Formation. The per Floridan aquifer is artesian and contains basic parts, an upper one yielding fresh water awthorn Formation) a lower part yielding salt ter (Tampa Formation). The two layers of the oridan aquifer are separated by an aquiclude. rections of flow, water quality and future poten-of all these hydrologic units are also examined. ampbell-NWWA)

**NEW LOOK AT SANDSTONE ACIDIZING,**
xon Production Research Co., Houston, Tex.
J. L. Gidley.
Petroleum Engineer, Vol 45, No 11, p 55-62, October, 1973. 1 fig, 4 tab, 1 ref.

Descriptors: *Secondary recovery(Oil), *Injection, *Oil reservoirs, Permeability, Porosity, Reservoir yield, Supply, Water supply, Water yield, Groundwater.
Identifiers: *Sandstone acidizing, *Hydrofluoric acid, *Acid mutual solvent(AMS) technique, Ethylene glycol monobutyl ether(EGMBE).

An improved technique for the use of mixed HF-HCl acids in stimulation of sandstone formations to increase productivity is described. This acid mutual solvent (AMS) technique is a 3-step process which involves: (1) a preflush with a regular hydrochloric acid to buffer formation waters and prevent reaction with the hydrofluoric acid; (2) a mixed stage of HF-HCl that dissolves clay minerals to increase porosity and permeability; and (3) an afterflush using a mutual solvent such as ethylene glycol monobutyl ether (EGMBE) to remove the deposited clay minerals. Some problems associated with this treatment and their prevention are discussed. (Bradbeer-NWWA)

Bureau of Mines, Bartlesville, Okla. Bartlesville Energy Research Center.
A. G. Collins.
Oil and Gas Journal, Vol 72, No 21, p 90-94, May 27, 1974. 3 fig, 25 ref.

Descriptors: *Groundwater, *Hydrocarbons, *Exploration, *Oil wells, *Geochemistry, Brines, Water types, Salinity, Iodides, Ammonium salts, Gulf of Mexico, Sandstone, Mesozoic era, Water utilization, Water chemistry.
Identifiers: Ethane, Butane, Smackover formation, Cretaceous.

Water is involved in the primary mechanisms that cause the accumulation, preservation, and destruction of oil and gas fields. A recent geochemical study on the Smackover (Gulf Coast - Cretaceous) indicated that knowledge of type, class, and dissolved constituents of the water is useful in exploration. The study examined reservoir samples of oil, gas, brine and rock as well as the traps involved. Certain dissolved constituents are favorable indicators of hydrocarbon accumulation such as iodide, ammonium, organic acid salts, ethane, butane, low sulfate concentrations, and the type of class of brine. Dry-hole indicators have also been determined and listed. (Bradbeer-NWWA)

**THERMODYNAMIC AND KINETIC ASPECTS OF ARGILLACEOUS SANDSTONE ACIDIZING,**
Institut Francais du Petrole, Rueil-Malmaison (France).
J. C. Labrid.
Society of Petroleum Engineers Journal, Vol 15, No 2, p 117-128, April, 1975. 18 fig, 3 tab, 12 ref.

Descriptors: *Sandstones, *Acids, *Thermodynamics, *Secondary recovery(Oil), Permeability, Porosity, Injection, Rates, Concentration, Groundwater, Aquifers, Aquifer management.
Identifiers: Hydrofluoric acid, Sandstone acidizing, Dissolution, Stimulated recovery.

The thermodynamic aspect of sandstone acidizing by hydrofluoric acid (HF) is examined. Silica dissolution, with a first order in HF concentration, leads almost exclusively to the formation of fluosilicic acid. Clay and feldspar dissolution is much more complex; after a uniform alteration of the crystalline lattice, partical precipitation of silicic species occurs when the acid is spent. An approach to the kinetic aspect is made by defining, for a naturally complex medium, a reactivity profile that is a characteristics of the medium instead of a single reaction-rate constant. Experimental data enable a correlation between permeability, porosity, and reactivity. Also, a qualitative interpretation of acid response curves is given. The numerical simulation of the acidizing process satisfactorily reproduces the experimental results. When extended to radial flow, the model shows the influence of stimulation parameters, injection rate, concentration, and time. (Campbell-NWWA)
W75-11891

**A LABORATORY STUDY OF THE EFFECTS OF CONFINING PRESSURE ON FRACTURE FLOW AND STORAGE CAPACITY IN CARBONATE ROCKS,**
Amoco Production Co., Tulsa, Okla.
F. O. Jones, Jr.
Journal of Petroleum Technology, Vol 27, p 21-27, January, 1975. 8 fig, 22 ref.

Descriptors: *Fracture permeability, *Reservoir yield, *Compaction, *Permeability, Groundwater, Withdrawal, Hydrostatic pressure, High pressure, Petroleum engineering, Laboratory tests, Fractures(Geologic), Storage capacity, Oil.
Identifiers: Net overburden pressure, Tectonophysics.

A study was made of the effects of increased net overburden pressures on fracture capacity as related to such an increase due to depletion of a fluid reservoir. Cores fabricated for controlled analysis and cores of reservoir rock samples were used similar for both sample types. A linear relationship was found between the cube root of permeability and the logarithm of confining pressure. (Bradbeer-NWWA)

**RESERVOIR PROPERTIES AFFECTING MATRIX ACID STIMULATION OF SANDSTONES,**
Chevron Oil Field Research Co., La Habre, Calif.
C. C. McCune, J. W. Ault, and R. G. Dunlap.
Journal of Petroleum Technology, Vol 27, p 633-640, May, 1975. 7 fig, 6 tab, 6 ref.

Descriptors: *Sandstones, *Permeability, *Flow augmentation, *Acid, *Secondary recovery(Oil), Injection, Oil reservoirs, Clogging, Porosity, Petrography, Mineralogy, Compressive strength.
Identifiers: *Mineral composition, *Matrix stimulation, Matrix dissolution.

Matrix stimulation means the dissolution and removal or relocation of minerals comprising the original formation matrix. A high-pressure, high-temperature acid permeameter was used in laboratory studies of sandstone formations to learn the

characteristics of a formation that make it a good or bad stimulation candidate. The age, compressive strength, mineral composition, original porosity and permeability of each of 20 samples were recoreded and compared to the response of the formation to the acid parmeameter. A single response indicator was derived from the composition, porosity and permeability of the tested sandstone. Generally, well-consolidated sands with high quartz-clay ratios are the best acidizing candidates. (Bradbeer-NWWA)

**LAND SUBSIDENCE IN THE SAN JOAQUIN VALLEY, CALIFORNIA, AS OF 1972,**
Geological Survey, Reston, Va.
J. F. Poland, B. E. Lofgren, R. L. Ireland, and R. G. Pugh.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, price $2.20. Professional Paper 437-H, 1975. 78 p, 78 fig, 8 tab, 39 ref.

Descriptors: *Land subsidence, *Irrigation wells, *California, *Hydrologic data, *Well data, *Aquifer characteristics, Water level fluctuations, Drawdown, Pumping, Withdrawal, Maps, Hydrographs, Water demand, Water yields, Groundwater movment, Groundwater recharge.
Identifiers: *San Joaquin Valley(Calif).

Land subsidence which began in the mid-1920's due to groundwater overdraft in the San Joaquin Valley, Calif., has caused widespread concern for the past two decades. Withdrawals for irrigation increased from 3 million acre-feet in 1942 to 10 million acre-feet 1966. Water levels declined at unprecedented rates during the 1950's and early 1960's. By 1970, 5,2000 square miles of valley land had been affected, and maximum subsidence exceeded 28 feet. Basic-data graphs and computer-plotted stress-strain relationships constitute a major part of this report. They are based on 10-13 years of detailed field measurements of both water-level change and compaction collected by the U.S. Geological Survey at 20 selected locations in the San Joaquin Valley. The recharge characteristics of a groundwater reservoir are indicated roughly by the volume ratio, which is subsidence/pumpage. In the Los Banos-Kettleman City area, the values of this ratio range from less than 0.2 near the perimeter to more than 0.6 in the central part of the area. In the corresponding parts of the Arvin-Maricopa area, the ratio ranges from near 0 to more than 0.4. (Woodard-USGS)

**LAND SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL IN THE LOS BANOS-KETTLEMAN CITY AREA, CALIFORNIA, PART 2. SUBSIDENCE AND COMPACTION OF DEPOSITS,**
Geological Survey, Reston, Va.
W. B. Bull.
Available from Sutp. of Documents, GPO, Washington, D.C. 20402, price $2.45. Professional Paper 437-F, 1975. 90 p, 66 fig, 9 tab, 39 ref.

Descriptors: *Land subsidence, *Groundwater, *Pumping, *California, Hydrogeology, Data collections, Hydrologic data, Structural geology, Compaction, Stress, Geomorphology, Aquifer characteristics, Groundwater mining, Geology, Water wells, Well data, Water utilization.
Identifiers: *San Joaquin Valley(Calif).

Pumping of groundwater has increased the stresses tending to compact unconsolidated deposits by as much as 50 percent, thereby creating the world's largest area of intense land subsidence in the west-central San Joaquin Valley, Calif. As of 1966, 2,000 square miles had subsided more than 1 foot, and the area that had subsided more than 10 feet was 70 miles long. Maximum subsidence was 26 feet. Subsidence rates increased until the mid-1950's when the maximum observed rate was 1.8 ft per yr, but have decreased since then. During the 1963-66 period the maximum subsidence rate was only 1.1 ft per yr. Subsidence due to artesian-head decline is of greater extent and magnitude than other types of subsidence in the area. In most of the area about 70-95 percent of the compaction occurs in the lower zone below th Corcoran confining bed. As much as 30-40 percent of the compaction occurs in the upper zone in the southern part of the area. Geologic factors that cause differences in specific unit compaction include total applied stress, lithofacies, and source and mode of deposition. (Woodard-USGS)
W75-11957

**LAND SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL IN THE LOS BANOS-KETTLEMAN CITY AREA, CALIFORNIA, PART 3. INTERRELATIONS OF WATER-LEVEL CHANGE, CHANGE IN AQUIFER-SYSTEM THICKNESS, AND SUBSIDENCE,**
Geological Survey, Reston, Va.
W. B. Bull, and J. F. Poland.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, price $1.90. Professional Paper 437-G, 1975. 62 p, 43 fig, 2 tab, 32 ref.

Descriptors: *Land subsidence, *Groundwater, *Pumping, *Aquifer systems, *California, Aquifer characteristics, Water table, Water level fluctuations, Data collections, Hydrologic data, Structural geology, Compaction, Stress, Geomorphology, Groundwater mining, Geology, Water utilization, Water management(Applied).
Identifiers: *San Joaquin Valley(Calif).

By increasing the stresses tending to compact the deposits by as much as 50 percent, man has created the world's largest area of intense land subsidence in the west-central San Joaquin Valley, Calif. As of 1966, more than 2,000 square miles had subsided more than 1 foot, and the area that had subsided more than 10 feet was 70 miles long. Maximum subsidence was 26 feet. The increase in stress caused by pumping of groundwater can be expressed in feet of water. A seepage of 1 foot of water occurs for each foot of head differential resulting from either artesian-head change or change in water-table position. Stress increase resulting directly from artesian-head decline has caused most of the compaction and subsidence. Changes in aquifer-system thickness may be both elastic (are reversible and occur with minor time delay) and inelastic (are irreversible and occur with large time delay). As of 1966 excess pore pressures existed in many of the aquitards and net aquifer-system expansion occurred briefly or not at all, but elastic changes did effect the monthly amounts of measured compaction. Importation of surface water has resulted in alleviation of subsidence in the Delta-Mendota Canal service area and in the vicinity of Stratford and Lemoore. (Woodard-USGS)

North Dakota Geological Survey, Bismarck, County Ground-Water Studies 23--Part II, and North Dakota Geological Survey Bulletin 66--Part II, 1975. 375 p, 2 fig, 1 plate, 7 tab, 22 ref, append.

Descriptors: *Groundwater resources, *Basic data collection,s *North Dakota, *Aquifer characteristics, *Water quality, Water wells, Well data, Groundwater movement, Water yield, Groundwater recharge, Transmissivity, Chemical analysis, Groundwater, Streams, Lakes, Particle size, Cores, Mineralogy, Sediments.
Identifiers: *Emmons County(N Dak).

This basic data report of groundwater in Emmons County, N.D. provides geologic and hydrologic information needed for the orderly development of water supplies for municipal, domestic, livestock, irrigation, industrial, and similar uses. Specifically, the objectives were to: (1) determine the location, extent, and nature of the major aquifers and confining beds; (2) evaluate the occurrence and movement of groundwater, including the sources of recharge and discharge; (3) estimate the transmissivity of the aquifer and the potential yields of wells; (4) determine the quality of the groundwater; and (5) estimate the water use. The data were collected chiefly between 1970 and 1973 and consist of the following: (1) Geologic and hydrologic records for 1,193 wells and test holes; (2) water-level measurements in 76 observation wells; (3) lithologic and geophysical logs of 413 test holes and wells; (4) 265 chemical analyses of groundwater; (5) 24 chemical analyses of water from streams and lakes; (6) 14 particle-size distribution graphs; and (7) heavy mineral determinations made from three cores taken from the Fox Hills Formation. California Univ., Davis. Dept. of Water Science and Engineering.
M. A. Marino.
Journal of Hydrology, Vol 25, No 3/4, p 201-208, May 1975. 4 fig, 14 ref.

Descriptors: *Artificial recharge, *Water spreading, *Numerical analysis, Digital computers, Aquifers, Water supply, Groundwater movement, Groundwater, Hydraulic properties, Hydraulic conductivity, Specific yield, Water table.
Identifiers: *Spreading basins, *Groundwater mound, *Dupuit equation, Water table profiles.

Artificial groundwater recharge is of increasing importance as an essential component of water management programs. The fluctuation of the

ater table in response to recharge depends on the ze and shape of the recharging area, on the dura- on and the type of variation of the recharge rate, nd on the hydraulic and geometric parameters of ie underlying aquifer. Numerical solutions escribing the formation of groundwater mounds ere obtained by applying the Douglas-Jones pre- ictor-corrector methods to the second order, non- near, partial-differential equation characterizing ie unsteady flow in an unconfined aquifer eneath a circular uniformly recharging area. An dvantage of using the method is that the predic- or-corrector equations result in a tridiagonal set f simultaneous equations which can be solved apidly in a digital computer. Furthermore, the ethod is computationally stable. (Schicht-ISWS)

**THE POTENTIAL FOR ENERGY PRODUCTION FROM GEOTHERMAL RESOURCES.**
Report--Subcomm. on Water and Power Resources--Comm. on Interior and Insular Affairs, U.S. Senate, 93d Cong, 1st Sess, December 1973. 40p.

Descriptors: *Geothermal studies, *Steam, *Electric power demand, Land, United States, Leases, Resources, Energy, Electricity, Electric power, Electric power production, Heat, Brines, Environment, Environmental effects, Environmental control.
Identifiers: *Environmental impact statement, Energy crisis.

The Geothermal Steam Act of 1970 was enacted to promote the orderly development of geothermal resources on public lands. The major device for achieving this objective is the authorization to the Secretary of the Interior to issue leases for the development and utilization of geothermal resources on public lands. The Subcommittee's 1973 report found that the geothermal resources of the United States hold a potential for the production of substantial amounts of energy in the form of heat and electric power. These potential geothermal technologies offer the possibility of providing environmentally attractice energy production. Geothermal resources occur in a variety of types and situations: dry-steam systems; wet-steams systems; hot dry-rock systems; and geopressured brines. The subcommittee recommended that the Department of Interior take steps to insure prompt issuance of final environmental impace statements, that a lead agency be designated to take responsibility for advancing geothermal energy resources and development, that exploration activity for geothermal energy resources be greatly accelerated, that research and developmental funding be increased, and that a financial assistance program be initiated to overcome some of the uncertainties associated with new technology development. **MANAGEMENT OF INTERSTATE GROUND WATER,**
Fischer and Beatty, Fort Collins, Colo.
W. H. Fischer.
Natural Resources Lawyer, Vol 7, No 3, p 521-546 (1974). 26 p, 85 ref.

Descriptors: *Groundwater availability, *Interstate compacts, *Equitable apportionment, Legal aspects, Legal review, Governments, State governments, Interstate commissions, Federal-state water rights conflicts.

The interstate compact and interstate litigation are presented as the best alternatives for solving managerial problems of depletion and pollution of interstate groundwaters. Private litigation tends to be sporatic and ineffective, while uniform groundwater laws or interstate groundwater districts, are limited legally and politically. Except for pollution control, federal legislation in the area is unlikely. The interstate compact is the most effective, sound and flexible solution to the problem, but unless increased responsibility and political accountability can be expected from the states, litigation between the various states resulting in equitable apportionment of groundwater may be the only practical implement for actual management of this resource. Identifiers: Pumping cost, Underground mining, Pressure tests, Drill-stem tests, Lab tests on core, Centrifugal pumps, Sumps, Pump stations, Submersible pumps, Pollution control, Pilot hole, Underground bulkheads.

Ground water flow has an important effect on the cost and progress of most mining operations. The presence of ground water limits the methods which can be used in some circumstances and presents hazards in others. However, the water table may reduce the flow of springs and wells, with legal liability. Some mine water is used directly, some must be treated before discharge, and some contains dissolved solids that can be recovered profitably. Topics covered in this chapter include: mine-water occurrence, effects and control; forecast of inflow; pumping and drainage; water in surface mining; mine-drainage pollution control; special construction for water control; and legal aspects of ground water control. Identifiers: *San Andreas Fault Zone(Calif.), Creep events, In situ pore pressure changes, Zone of active tectonic creep, Zone of seismicity.

Observations of the water-level changes in a well drilled into the San Andreas fault zone have been under way since May, 1971, with the objective of studying in situ pore pressure changes in a zone of active tectonic creep and seismicity. Small water-level changes, characterized by a decrease and subsequent rise have been followed by earthquakes of moderate size on the San Andreas fault zone. Compatibility of these observations with either a dilatancy-type behavior or a dislocation-type behavior for the pre-earthquake process can be demonstrated. Additional water-level observations at other sites in the fault zone are needed to examine the spatial and temporal extent of the actual preseismic process that is responsible for observed creep events, water-level changes, and tilt changes. CONTROL OF GROUNDWATER AT BANCROFT MINES, ZAMBIA,
W. J. Whyte, and R. A. Lyall.
In: Ninth Commonwealth Mining and Metallurgical Congress 1969, Mining and Petroleum Geology Section, Paper 16, 32 p, 13 fig, 2 tab, 6 ref.

Descriptors: *Groundwater, Wells, *Mining, *Dewatering, Aquifer characteristics, Drilling, Hydrogeology, Groundwater recharge, Pumping, *Africa.
Identifiers: Wet mine, *Zambia, Surface drainage modifications, Cone of dewatering.

Bancroft Mines, Ltd., a copper-producing company situated at the northern end of the Zambian Copperbelt, hoisted 160,000 tons of ore per month and pumped an average daily volume of 65,000,000 gal of water to surface in mid-1968. The large volumes of water encountered and expected during mining are a major consideration in mine planning. The progress of dewatering relative to stoping is checked by regular estimates of the water level in each main aquifer, by underground observations, pressure measurements on underground boreholes and water-level measurements in surface boreholes. The main pumping installations at the mine are currently capable of delivering to surface a sustained volume of 75,000,000 gal/day. Underground water control measures in the event of a major power failure involve the flooding of selected levels, providing a no-pumping storage capacity of not less than four hours before shaft installations are affected. On surface, extensive modifications have been made to the natural drainage in order to divert a major tributary of the Kafue River from an area subject to caving overlying the orebodies and to increase runoff during seasonal storms and, hence, reduce recharge into the aquifers. An understanding of the geological characteristics of the various aquifers and an appreciation of the reliability or limitations of available geological data are essential to any assessment of the water hazards involved in underground development at Bancroft. FRESH WATER STRATA OF MISSISSIPPI AS REVEALED BY ELECTRICAL LOG STUDIES,
Millsaps Coll., Jackson, Miss.
R. R. Priddy.
Mississippi State Geological Survey, Jackson, Bull 83, 71 p, 1955. 7 fig, 1 tab.

Descriptors: *Groundwater, *Water wells, Well logging, *Subsurface waters, Water quality, Mississippi, Electrical logging, *Drilling, Oil wells.
Identifiers: *Fresh-water sands, Paleozoic aquifers, Tertiary aquifers, Mesozoic aquifers.

The probable geographic (Lateral) distribution of the subsurface fresh-water-bearing sands of Mississippi and their stratigraphic (Vertical) distribution were determined by a study of nearly 500 electric logs of oil tests, selected from more than 3,500 logs. Most of the data--distribution of wells, and number and stratigraphic position of the aquifers they show--were obtained from 158 logs. The overall purpose of the investigation was to provide aid for planning to drill for drinking water, water for industrial use, or water for agricultural use. (Campbell-NWWA)

TRAINING OF SUTLEJ RIVER BELOW RUPAR HEADWORKS FOR THE PROTECTION OF BIST DOAB CANAL: MODEL STUDIES,
Hydraulic Research Station, Malakpur(India).
G. Singh, and B. D. Sharma.
Indian Journal of Power and River Valley Development, Vol. 22, No. 12, p 479-484, December, 1972. 8 fig, 1 tab.

Descriptors: *Model studies, *Erosion, *Rivers, River training, Bank erosion, Erosion control, Bank protection, Structural models.
Identifiers: *India, Armored spurs.

The Sutlej River below Rupar Barrage, India, started eroding its right bank opposite the Bist Doab Canal, which runs parallel. The river edge had come as close to the canal as 48.77 meters. The Punjab Irrigation and Power Research Institute investigated remedial measures to check further erosion of the river bank. A model of Sutlej River, Rupar Barrage, and the necessary reach of the Bist Doab Canal was constructed to a horizontal scale of 1/150 and a vertical scale of 1/30. The model was run with different discharges and different remedial measures were examined. Ultamately a scheme comprising construction of three armored spurs, each 33.53 meters long, on the right bank of the river was finalized. Balli sarkanda spurs were constructed in 1970. These temporary structures function satisfactorily and give the necessary protection to the right bank. (Sandoski-FIRL)

entifiers: Interferences, *Rare earth elements, tomic absorption spectrometry, Gadolinium, sprosium, Neodymium, Samanium, Yttrium.

e inherently poor sensitivities and detection nits for most of the rare earth elements, when mpared with some of the more common ele-ents, makes difficult the application of atomic sorption to the determintation of trace concen-tions. Many chemical interferences occur in the termination of these elements. This was con-med by measuring the absorbance of the ele-ents Gadolinium, Dysprosium, Neodymium, marium and Yttrium in a mixed solution on a nicam SP1900 double beam spectrophotometer, d comparing the results with the absorbance of eir individual solutions. Careful attention must given to the problem of interferences arising om minerial acids and other rare-earth elements; so the critical nature of the basic instrumental rameters must be realized. entifiers: Unconfined aquifer, Hexavalent romium.

technique for sampling formation water at ecific horizons during drilling was developed in investigation of contamination by chromium. e technique consists of: (1) drilling a borehole to e base of a sampling horizon; (2) lowering a wire-ound well screen and riser pipe to the bottom of e hole and gravel-packing the screen; (3) pump-g the borehole well until the discharge is clear of illing fluid; and (4) pumping at least 100 gallons of formation water before collecting the sample and performing field water quality tests. Analysis of water samples withdrawn from five wells, drilled to and screened at specific depths, verified the new technique was valid. This new procedure was then used to substantiate surface earth-resistivity data and determine the vertical distribution of the contaminant with time as the wells are also screened for sampling after drilling completion. Connecticut Univ., Groton. Marine Sciences Inst.; and Connecticut Univ., Groton. Dept. of Geology.
W. F. Fitzgerald, and W. B. Lyons.
Limnology and Oceanography, Vol 20, No 3, p 468-471, May, 1975. 1 tab, 18 ref.

Descriptors: *Heavy metals, *Mercury, Analytical techniques, *Oceans, *Sea water, *Sampling, Trace elements, Atlantic Ocean, *Pollutant identification.
Identifiers: Teflon ware, PVC.

Accurate Hg determination in sea water depends significantly on careful sampling at sea and on the sample storage procedure. Unusually large blank values were occasionally observed both for pyrex containers and glass BOD bottles. Collections made in PVC samplers and relatively expensive Teflonware showed no significant difference. Cold-trap preconcentration was followed by measurement of Hg by gas phase atomic absorption spectrophotometry. The PVC sampler was found suitable for collecting sea water samples at depth for Hg determinations. Hg concentrations averaged 8 plus or minus 3 ng per liter in surface water in the northwest Atlantic ocean. (Delfiner-Vanderbilt)

**WATER RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN THE NORTHERN GREAT PLAINS COAL REGION OF WYOMING, MONTANA, AND NORTH DAKOTA, 1975.**
Geological Survey, Denver, Colo. Water Resources Div.
Open-file report, May 1975. 110 p, 27 fig, 27 ref.

Descriptors: *Water resources development, *Water quality, *Projects, *Coal mine wastes, *Great Plains, Wyoming, Montana, North Dakota, Water pollution sources, Programs, Evaluation, Data collections, Chemical analysis, Sediment transport, Streamflow, Groundwater resources, Observation wells, Water quality control.
Identifiers: *Northeast Great Plains, *Coal regions(U.S.).

The Geological Survey's Water Resources Division has for many years maintained a program of water-resources investigations that includes the coal regions of Wyoming, Montana, and North Dakota. The recent interest in coal has added new dimensions and greater intensity to the investigations. The work has expanded to include monitoring the environmental effects of coal mining and processing and to determine the availability of additional water supplies for coal-conversion plants and related demands. This report describes the water-resources investigation program that is currently in operation. Locations of gaging stations and water-quality measuring sites, frequencies and parameters, and areas of groundwater studies are included. Brief descriptions of coal-related studies by investigators who are headquartered outside the Northern Great Plains coal regions are also included. Such studies are research in topics related to coal extraction, water supply, and post-mining reclamation. (Woodard-USGS)

Available from the National Technical Information Service, Springfield, Va. 22161 as N74-20016. NASA-CR-137268 (Undated). 26 p, 8 fig, 2 tab, 19 ref. NASA NGL 50-002-127.

Descriptors: *Aerial photography, *Analytical techniques, *Water pollution, *Waste dilution, Spectrophotometry, Mixing, Pulp wastes, Wisconsin, Discharge measurement, Waste water(Pollution), Suspended solids.
Identifiers: *Mixing zone, Kimberly-Clark Corp.(Wis.), Fox River(Wis.).

To quantitatively delineate waste concentrations throughout waste effluent mixing zones, a method was developed based on densitometric measurements obtained from aerial photography. Simultaneously acquired color infrared photography and suspended solids water samples were used to delineate the mixing zone resulting from discharge of a Kimberly-Clark paper mill effluent at Kimberley, Wisconsin. A mixing zone is defined as the extent a receiving water body utilizes to dilute a waste discharge to a concentration characteristic of a totally mixed condition. Digital scanning microdensitometer data was used to estimate and delineate suspended solids concentrations on the basis of a semi-empirical model. It is shown that photometry, when predicated on a limited amount of ground sampling, can be used to measure and define mixing zone waste distributions are reliably and in more detail than conventional surface measuring techniques. The method has direct application to the establishment of definite and rational water quality guidelines, the development of sampling and surveillance programs for use of government and primate agencies, and the development of design and location criteria for industrial and municipal waste effluent outfalls. (Buchanan-Davidson--Wisconsin)

**THE RISK OF DEOXYGENATION OF WATER IN HERBICIDE APPLICATION FOR AQUATIC WEED CONTROL,**
University of Wales Inst. of Science and Tech., Cardiff.
M. P. Brooker.
Journal Institution of Water Engineers, Vol 28, No 4, p 206-210, 1974. 2 fig, 1 tab, 9 ref.

Descriptors: *Aanerobic conditions, *Herbicides, *Aquatic weed control, *Oxygen demand, Diquat, Paraquat, Submerged plants, Aerobic conditions, Aquatic plants, Decomposing organic matter, Phytoplankton, Fishfill, Estimating, Equations, Europe.
Identifiers: Barry Reservoir(Wales), Oxton Lake(England).

One danger of application of herbicides (such as diquat and paraquat) to control aquatic submerged plants is risk of water deoxygenation due to aerobic decomposition of dead plant material. Aerobic decomposition of aquatic macrophytes and phytoplankton can be described by a first order equation relating rate of decomposition change to biodegradable mass. A scheme is described to enable those responsible for water management to assess the risk of deoxygenation during herbicide application. Dissolved oxygen concentration levels to avoid fish mortality can be calculated. Oxygen resources available for aerobic decay processes in relation to oxygen requirements for fish survival at varying water depths and the maximum plant freshweight per unit area which can be treated with herbicide without producing severe water deoxygenation can be calculated. Hypothetical examples of how to assess deoxygenation risk are presented. The method was used successfully in Barry Reservoir, South Wales, but minimum recorded oxygen concentrations were higher than predicted; no fish deaths were recorded. In Oxton Lake, Nottinghamshire, treatment with paraquat resulted in reduction in dissolved oxygen concentrations and fish deaths occurred; the predicted minimum concentration was higher than the observed minimum concentration. (Buchanan-Davidson--Wisconsin)

**A NOTE ON THE ELEVATION OF THE MEAN AND THE MODE OF THE GAUSSIAN CONCENTRATION DISTRIBUTION,**
National Oceanic and Atmospheric Administration, Oak Ridge, Tenn. Air Resources Atmospheric Turbulence and Diffusion Lab.
F. A. Gifford.
In: 1973 Annual Report; Report ATDL-106, Air Resources Atmospheric Turbulence and Diffusion Laboratory, Oak Ridge, Tennessee, p 31-35, December 1974. 2 fig.

Descriptors: *Model studies, *Mathematical models, *Powerplants, *Path of pollutants, Equations, Winds, Average, Distribution patterns, Atmosphere, Air pollution.
Identifiers: *Plumes, Plume models, Concentration distributions, Powerplant stacks, Gaussian distributions.

In an infinite atmosphere with constant wind, u, the elevation of a Gaussian plume would be constant. The usual assumption of complete ground reflection alters this, as would the assumption of absorption. In view of the widespread use of this plume model, it is of interest to obtain the equations governing the height of the mean and the mode of the concentration distribution. The behavior exhibited by these curves agrees at least qualitatively with what would be expected. Near the stack both the mean and the mode are located at stack height. Farther downwind, near the point at which the vertical spreading, sigma sub z, grows to near the stack height, the pattern changes. The height of the mean then increases for both reflection and absorption as sigma sub z increases, whereas, for reflection, the mode decreases abruptly to zero. (See also W75-12033) (Sims-ISWS)

**LIDAR VS. PHOTOMETER, A ONE MONTH COMPARISON,**
National Oceanic and Atmospheric Administration, Oak Ridge, Tenn. Air Resources Atmospheric Turbulence and Diffusion Lab.
W. M. Culkowski, and S. D. Swisher.
In: 1973 Annual Report; Report ATDL-106, Air Resources Atmospheric Turbulence and Diffusion Laboratory, Oak Ridge, Tennessee, p 37-46, December 1974. 4 tab, 6 ref.

Descriptors: *Air pollution, *Instrumentation, *Measurement, Turbidity, Photometry, Remote sensing, Optical properties, Air environment.
Identifiers: *Lida, Particulates.

Results were presented for September 1972 of a comparison between turbidity data and lidar backscattering data. Correlations of +0.99 were obtained for one set of data, but on a semilogarithmic rather than linear basis. The monthly turbidity from the photometer averaged 0.281 (10 cases). The turbidity derived from the lidar reading was 0.305 (20 cases). Comparisons with a distant particulate sensing station were also presented. The correlation between Oak Ridge lidar and Chattanooga particulate matter suggested that most particulate matter observed is from natural, or at least ubiquitous, sources. (See also W75-12033) (Sims-ISWS)
W75-12036

**APPLICATION OF A SIMPLE DISPERSION MODEL TO A RURAL INDUSTRIAL REGION,**
National Oceanic and Atmospheric Administration, Oak Ridge, Tenn. Air Resources Atmospheric Turbulence and Diffusion Lab.
S. R. Hanna.
In: 1973 Annual Report, Report ATDL-106, Air Resources Atmospheric Turbulence and Diffusion Laboratory, Oak Ridge, Tennessee, p 47-62, December 1974. 4 fig, 4 tab, 10 ref.

Descriptors: *Model studies, *Air pollution, *Tenneessee, *Dispersion, Mathematical models, Powerplants, Industries, On-site data collections, Winds, Wind velocity, Pollutants, Path of pollutants, Rural areas.
Identifiers: *Particulate concentrations.

A simple dispersion model for multiple point and area sources was applied to the Rockwood-Harriman, Tennessee, region, which contains two small towns and two major industries. Predicted annual average suspended particle concentrations were well correlated (r = 0.95) with observations at four stations. Variations in daily average concentrations at the four stations were partly accounted for (r = 0.5) by variations in daily average wind speed. (See also W75-12033) (Sims-ISWS)

IFFUSION ESTIMATION FOR SMALL EMIS-IONS,
ational Oceanic and Atmospheric Administra-on, Oak Ridge, Tenn. Air Resources Atmospher- Turbulence and Diffusion Lab.
. A. Briggs.
: 1973 Annual Report; Report ATDL-106, Air esources Atmospheric Turbulence and Diffusion aboratory, Oak Ridge, Tennessee, p 83-145, ecember 1974. 4 fig, 1 tab, 19 ref, 5 append.

escriptors: *Air pollution, *Diffusion, Dispersion, Fallout, Pollutants, Effluents, owerplants, Industries, Industrial wastes, uoyancy, Winds, Wind velocity, Path of pollu-ns, Air circulation.
dentifiers: *Stack effluents, Small emission, erodynamic effects, Particle concentrations, round level concentrations.

simplified approach to the calculation of ground vel concentrations of effluents from sall industri- and fuel burning installations was described. It as intended to serve as a first approximation to a ery complex process. Because each stack, build-g, and terrain configuration is different, actual round concentration may frequently differ from e calculated values by a factor of two. Nonethe-ss, this procedure should be useful for determing hether ambient air quality standards are likely to e met, exceeded, or only marginally obtained. It lso predicts the locations where the highest and ost frequent ground concentrations are likely. ampling at several such locations is very advisa-le, unless the predicted concentrations are quite w. These procedures were designed especially r source heights of less than 100 m. Some of the mplifications made are not valid for large emis-ons. (See also W75-12033) (Sims-ISWS)

INORGANICS, (LITERATURE REVIEW),
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
R. A. Minear, J. S. Henderson, C. L. McEntyre, and R. R. Rose.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1118-1162, June, 1975. 429 ref.

Descriptors: *Reviews, *Water analysis, *Chemical analysis, *Inorganic compounds, Lakes, Rivers, Oceans, Radiochemical analysis, Neutron activation analysis, Spectrophotometry, Colorimetry, Sampling, *Bibliographies, *Pollutant identification.

An in-depth review of current literature on the nature and analysis of chemical species, with inorganics in particular, is presented. Water samples from various types of oceans, lakes, and rivers as well as effluent discharges were analyzed. Sample concentration and separation techniques are described. Much literature has been reported on the application of instrumental techniques including atomic absorption spectrophotometry, flameless atomic absorption, atomic fluorescence, emission spectroscopy, gas and liquid chromatography, electrochemical analysis, neutron activation analysis, and other radiochemical techniques. Tables are given for a cross reference to the specific analytical methods and individual constituents. Colorimetric and titrimetric methods were conducted for halogens, ozone, sulfur compounds, cyanide, boron, silicon, phosphorus, nitrogen, iron, manganese, and aluminum, as well as for various transition metals. (Kramer-FIRL)

WATER CHARACTERISTICS, (LITERATURE REVIEW),
Maine Univ. Orono.
J. A. Olofson, and M. M. Ghosh.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1161-1169, June, 1975. 73 ref.

Descriptors: *Reviews, *Water analysis, Heavy metals, Analytical techniques, Eutrophication, Water quality, Water chemistry, Suspended solids, Turbidity, Odor, Toxicity, *Bibliographies, *Pollutant identification.
Identifiers: Ligands, Voltammetry, Spectrophotometry.

A review of the literature on analytical techniques for determination of water characteristics is presented. Attention has been given to the finding of heavy metals and associated ligands in natural waters. Analytical procedures such as voltammetry and pulse polarography are described. Naturally occurring Fe fractions in seawater have been examined. Calculations have also been made to assess the degree to which Hg(II), Cd(II), Zn(II), and Pb(II) form complexes with hydroxyl and chloride ions in natural systems. Transport of heavy metals by water and bottom sediments has been investigated. Other methods of water analysis were atomic absorption spectrophotometry for arsenic determination, uv and visible spectrophotometric methods for trace metal speciation, and liquid-liquid extraction of organic compounds. Further studies included the retention of phosphate and sulfate by muscovite, thermal aspects of aquatic chemistry as related to effects upon physical-chemical parameters, and a phosphorus model related to lake eutrophication. A new index of water quality has been proposed, based on temperature, nutrients, ss, turbidity, coliform bacteria, DO, color, odor, and toxicity; it has been applied to surface waters in Tennessee. Reviews have also been made of various aspects of natural water chemistry with regard to bioassay evaluation of water quality. (Kramer-FIRL)

J. C. Van Loon.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 234-248. (1974) 9 tab, 10 ref.

Descriptors: *Analytical techniques, *Heavy metals, *Sewage sludge, *Pollutant identification, Iron, Lead, Copper, Cadmium, Nickel, Zinc.

The equipment and techniques for the analysis of heavy metals in sewage sludge and liquids associated with sludges are presented. It is questionable whether a grab sludge sample can be considered as representative of the sludge in a digester tank. Data presented suggest that the majority of the sludge water metal is bound tightly and therefore is not readily detectable using extractable metal procedures. Nickel, copper, and cadmium appear to be little affected by filter porosity size. Lead was found in the solids residue trapped by a 60 micron porosity filter. The metal contents of sludges ranged from: 2-147 ppm Cd; 16-16000 ppm Cr; 85-4000 ppm Pb; 7-1500 ppm Ni; 162-3000 ppm Cu; 1-24 ppm Hg; 60-500 ppm Mn; 4-60 ppm Ag; 610-19000 ppm Zn; 0.33-7.4 ppm Fe; and, 0.10-3.9 ppm Al. The analytical techniques used allowed the detection of cadmium and zinc above 0.2 ppb and the detection of iron, lead, copper and nickel above 1.0 ppb. The high metal levels detected in sewage treatment plant products in this study demonstrate a need for research into the fate of these metals after reacting with terrestrial and acquatic environments. CHEMICAL TESTS FOR PLANT AVAILABLE METALS IN SOILS.
Guelph Univ. (Ontario). Dept. of Land Resource Science.
T. E. Bates, and A. Haq.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 267-268. (1974) 3 ref.

Descriptors: *Soils, *Nutrients, Crops, Sewage sludge, *Cadmium, *Copper, *Metals, Pollutant identification, Canada.
Identifiers: Ontario, EDTA, DTPA, Ammonium acetate.

The amount of nutrient in soil available to plants is not necessarily related to the total amount in the soil. A study is now in progress to determine a suitable extractant to measure plant available metals in soils in Ontario. Emphasis has been placed on cadmium and copper which are important pollutants of sewage sludge. Thirty-five soils with varying amounts of copper and cadmium contamination have been collected in Ontario. Swiss Chard has been grown on the soils. An analysis

will be made of the chard to determine the metal content in soils extracted with EDTA, DTPA, ammonium acetate, and other chemicals. The metal extracted from the soils will be correlated with the metal uptake by the Swiss Chard. It is hoped that this experiment will determine an extractant that will give satisfactory measure of plant available metals. (See also W75-11715) (Dean-FIRL)

**APPLICATION OF THE METHYLTHYMOL BLUE SULFATE METHOD TO WATER AND WASTEWATER ANALYSIS,**
Ontario Ministry of the Environment, Rexdale, Water Quality Branch.
J. M. Adamski, and S. P. Villard.
Analytical Chemistry, Vol 47, No 7, p 1191-1194, June, 1975. 3 fig, 2 tab, 6 ref.

Descriptors: *Analytical techniques, *Sulfates, *Water analysis, Gravimetric analysis, Economics, *Pollutant identification, Methodology.
Identifiers: *Methylthymol blue method, Precision analysis.

The present standard sulfate method for water and waste water analysis is the gravimetric method. However, this method is tedious and time consuming. A faster Methylthymol Blue technique has tested to be satisfactory. A comparative study of the two methods is presented. Both methods were evaluated by finding the differences between duplicate analyses for samples of 'waters'(clear samples from water supplies), 'rivers' (natural surface waters), and 'sewage' (raw inputs from domestic treatment plants as well as final effluents from both municipal and industrial sources) containing sulfate in a 0-50 mg/liter and a 0-200 mg/liter range. For precision, sensitivity, and number of interferences, the automated Methylthymol Blue method was analytically superior to the gravimetric method. It was also economically advantageous, having lower costs per analysis, a greater analysis speed, and smaller bench space requirements for performing the analysis. (Kramer-FIRL)

J. M. Foster, and B. I. Sherwood.
Oecologia, Vol 18, No 2, p 155-194, 1975. 4 fig, 1 tab, 34 ref.

Descriptors: *Groundwater, *Recharge, *Water reuse, Analytical techniques, Monitoring, Chlorophyll, Photosynthesis, Carbon, Lakes, Eutrophication, Arizona, *Pollutant identification.
Identifiers: Phoenix(Ariz), Physico-chemical studies, Biological analysis.

A study was made to evaluate the potential of water reclamation as a solution to water pollution and water storage problems. Physico-chemical and biological studies of recharged-groundwater at the Flushing Meadows Infiltration basins in Phoenix, Arizona, have been carried out, where part of the reclaimed waste water is stored in small artificial ponds. One desert pond (West Pond) was monitored for irradiance, chlorophyll a concentration, respiration, and net and gross photosynthesis. Over a six-month period, chlorophyll a concentration averaged 119 mg/cu m. Gross primary productivity in terms of mean daily carbon fixation rate was 8.29 C/cu m, which is less than many polluted eutrophic lakes and streams and is roughly equivalent to productive fish and farm ponds. A maximum value of gross assimilation number at 0.16 cal/sq cm/min of 30 mg C/hr per ml chlorophyll a indicate that this pond has an excellent photosynthetic capacity. (Prague-FIRL)

Massachusetts Inst. of Tech., Cambridge. Dept. of Chemistry.
R. J. Stolzberg, and D. N. Hume.
Anal Lett, Vol 6, No 9, p 829-837, 1973.

Descriptors: *Pollutant identification, *Gas chromatography, Analytical techniques, *Nitrilotriacetic acid, Organic acids, Biodegradation, Water pollution sources
Identifiers: Acetate, Amino, Anions, Bacterial, Biological, Carboxylate, Cation, Chelating, Chromatography, Degradation, Detergent, Determination, Environmental Esters, Growth, Interference, Laundry, Media, Methylsilyl, Nitrilo, Poly, Replacement, River, Spiked, Tri, USA, Water.

A rapid, sensitive gas chromatographic method for the determination of NTA (nitrilo-triacetate) as its trimethylsilyl ester was developed. The method is not subject to interference by common cations, a wide variety of anions, or other aminopolycarboxylate chelating agents. Satisfactory determinations of NTA in the low ppm range were carried out in artificial standards, spiked river water and bacterial growth media. The method is suitable for following biological degradation of NTA which has been suggested as partial replacement for phosphates in laundry detergents in the USA.--Copyright 1974, Biological Abstracts, Inc.

Gig Sanit., Vol 38, No 5, p 69-72, 1973.

Descriptors: *Pollutant identification, *Gas chromatography, *Organic acids, *Pesticides residues, Standards, Chromatography, Water quality standards, Analytical techniques.
Identifiers: Esters, Gas-liquid chromatography.

Quantitative methods were developed for determining residual quantities of the vapors of the butyl ester of 2,4-D in air (sensitivity 0.3 ug/1) and of this butyl ester in water (sensentivity 10 ug/1) by means of gas-liquid chromatography. There is no need for a quantitative analysis if an internal standard having similar physiocochemical properties to the pesticides being analyzed is added to the sample before extraction. In the given case the methyl ester of 2,4,5-trichlorophenoxyacetic acid was used as the internal standard.--Copyright (c) 1974, Biological Abstracts, Inc.

Geological Survey, Anchorage, Alaska.
D. E. Donaldson, P. J. Still, and C. Zenone.
Open-file report, 1975. 59 p, 1 fig, 1 plate, 10 tab, 12 ref.

Descriptors: *Basic data collections, *Water quality, *Surface waters, *Groundwater, *Alaska, Chemical analysis, Inorganic compounds, Biochemistry, Physical properties, Streamflow, Sediment transport, Sediment yield, Particle size, Sampling, Sites, Maps.
Identifiers: *Anchorage(Alaska).

This compilation of selected water-quality data was collected in Anchorage and vicinity, Alaska, between 1948 and 1973. The surface and groundwater data include concentration of individual constituents, as well as certain properties or characteristics such as hardness, specific conductance, pH, temperature, and color. Fluvial-sediment data include suspended-sediment concentration, suspended-sediment discharge, and particle-size distribution of suspended sediment. In 1973, wells were drilled within and adjacent to the Greater Anchorage Area Borough's landfill (solid-waste disposal site) near the Anchorage International Airport and at a landfill on Elmendorf Air Force Base to determine the presence and

emical characteristics of any leachate produced the landfills. Water-quality data from the wells e included in tables. (Woodard-USGS)

escriptors: *Throughfall, *Nutrients, Rain, erosols, *Loblolly pine trees, Coniferous trees, lica, Phosphates, Ammonia, Sulfates, Nitrates, kalinity, Potassium, Sodium, Calcium, ydrogen ion concentration.

he objective was to provide an estimate of the lative importance of nutrient enrichment from o sources, biologic materials and aerosols, as-ciated with rain falling through a pine canopy. A ot of loblolly pines was divided into one half that as left as it was and the other half that was en-osed in an attempt to isolate it from aerosols. ain water and water from the throughfall and emflow of the trees were analyzed for silica, osphate, ammonium, sulfate, nitrate, pH, al-linity, potassium, sodium, and calcium. It ap-ars that there is little difference in enrichment ctors from the enclosed versus the open trees, at the contribution of aerosol material to the dis-lved load of throughfall is minimal. There also pears to be no net loss of constituents from the nopy of young, growing loblolly pines in very nse stands except for potassium.

**THE EFFECT OF WIND ON THE SPREAD OF CONTAMINATION IN THE YEISK ESTUARY, (IN RUSSIAN),**
V. A. Prokopenko, O. L. Davydov, O. V. Mezhera, and Y. M. Khabakhbashev.
Gig Sanit, Vol 3, p 101-103, 1974.

Descriptors: *Estuaries, Water pollution, Soil contamination, *Winds, Beaches, *Sewage effluents, Sea water, Analysis, *Water pollution sources, *Path of pollutants.
Identifiers: *Yeisk(RFSFR), USSR.

The influence of wind on the effect of sewage discharge on water usage areas, such as beaches, in the Yeisk estuary and the city of Yeisk (Russian SFSR, USSR) was investigated during 1967-1970. During the summer, the city was inhabited by 70,000-75,000 people. The sewage was discharged into the Yeisk estuary. The mean yearly wind velocity in Yeisk was 6.1 m/s. Pollution reached the beach areas in 4 h. The chemical and bacteriological quality of the sea water in the sewage discharge area was studied. East and northeast winds led to pollution of the mouth of the estuary. West and southwest winds favored pollution of the beach areas between Yeisk and Shirochanka. The intensity of the dilution process with increasing wind strength increased only in the areas nearest to the sewage outlet.--Copyright 1975, Biological Abstracts, Inc.

**DISPERSION AND SETTLING AROUND A WASTE DISPOSAL POINT IN A SHALLOW SEA,**
Liege Univ. (Belgium). Institut de Mathematique.
J. C. J. Nihoul, and Y. Adam.
Journal of Hydraulic Research, Vol 13, No 2, p 171-186, 1975. 5 fig, 5 ref.

Descriptors: *Waste disposal, *Tidal effects, *Mathematical models, *Turbidity, *Diffusion, Shear, Sediment transport, Dispersion, Data collections, Estuaries, Numerical analysis, Fluid mechanics, Shallow water, Sea water, Tides, Water pollution sources, *Path of pollutants.
Identifiers: *Belgian coast, Tidal cycle.

Waste disposal into the sea gives rise to pollution problems associated with local increases in turbidity and the deposit of sediment on the sea bed. Turbidity reduces depth of penetration of sunlight and hence the chlorophyll synthesis intensity. The diffusion mechanism in shallow seas is essentially two-dimensional, and estuary diffusion models have to be generalized to make allowance for the rotation of the earth. Equations were derived that govern the horizontal dispersion of a pollutant in the sea under the influence of the two-dimensional shear effect on settling and removal of sediment from the bottom during the part of the tidal cycle when bed shear stress exceeds the critical value. It was shown that the shear effect gives rise to anisotropic dispersion. A numerical method of solution was developed and applied to actual dumping of wastes off the Belgian coast. Tidal currents predominated in the example area. The results obtained were in agreement with observations made in the course of dump supervision operations. (Singh-ISWS)

**VERTICAL TEMPERATURE PROFILES IN OPEN-CHANNEL FLOW,**
Dar es Salaam Univ. (Tanzania).
E. J. Schiller, and W. W. Sayre.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY6, Paper 11389, p 749-761, June 1975. 7 fig, 16 ref, 2 append. OWRT C-3140(3692)(2). NSF GK-5918.

Descriptors: *Dispersion, *Thermal stratification, *Water pollution, *Open channels, Hydraulics, Stratified flow, Thermal pollution, Temperature, Open channel flow, Mixing, Heat transfer, Buoyancy, Turbulent flow, Distribution, Profiles.
Identifiers: Bulk mixing coefficient.

Methods were presented for predicting vertical mixing of heated surface effluents in the far-field mixing region. A set of laboratory flume experiments covered a range of flows from well-mixed to nearly stably stratified conditions, over a range of conditions commonly encountered in practice. The data, together with analysis based on the convection-diffusion equation, were used to determine: (1) the distance for nearly complete mixing; (2) a bulk mixing coefficient, K sub y, for rapidly mixing flows; and (3) the vertical distribution of the overall vertical heat transfer coefficient, E sub Ty, at downstream cross sections. Buoyancy effects were reflected in the vertical distribution of E sub Ty. Stratification sharply inhibited vertical mixing near the surface and reduced vertical mixing throughout most of the depth. For rapidly mixing flows, the vertical heat transfer coefficient agreed closely with the turbulent mass and momentum transfer coefficient. (Lee-ISWS)

**POLLUTION EFFECTS ON SURFACE WATERS AND GROUNDWATERS,- (LITERATURE REVIEW),**
Hawaii Univ., Honolulu. Dept. of Civil Engineering.
R. H. F. Young.
Journal Water Pollution Control Federaton, Vol. 47, No. 6, p 1600-1610, June, 1975. 95 ref.

Descriptors: *Water pollution, *Reviews, *Groundwater, *Surface water, *Water pollution sources, *Water pollution effects, Water pollution control, Nutrients, Phosphorus, Nitrogen, Heavy metals, Phenolics, Organic compounds, Urban runoff, Model studies, *Toxicity, Aquatic organisms, Thermal pollution, Pesticides, Radioactive wastes, Bibliographies.
Identifiers: Non-point sources.

The 1973-74 literature dealing with the pollution of surface and groundwaters was reviewed. Topics covered included: nutrients in surface waters; runoff and waste discharges; groundwater pollution; land and subsurface disposal of waste water; heavy metals; radionuclides; biological contamination; thermal discharges; and models and indexes of water quality. Phosphorus and nitrogen studies were performed with regard to levels, relationship to productivity, sources, and control. Carbon chloroform extract, phenol, DDT, PCB, heavy metals, soil and grease, and coliforms are constituents of runoff and waste discharge. The toxicity of chlorine residuals to aquatic organisms was investigated. Hydrocarbons in sediments and the environmental effects of outboard motor subsurface exhausts were reported. Urban runoff and non-point sources received more attention than in previous years. Causes, effects, controls, and monitoring of groundwater pollution are discussed. Sources and toxic effects of heavy metals are reported. Orr-FIRL

**ORGANICS, (LITERATURE REVIEW),**
Drexel Univ., Philadelphia, Pa. Dept. of Environmental Engineering and Science.
I. H. Suffet, S. Friant, C. Marcinkiewicz, M. J. McGuire, and D. T-L. Wong.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1169-1241, June, 1975. 13 tab, 701 ref.

Descriptors: Water pollution, *Reviews, *Organic compounds, *Water pollution sources, Water pollution control, Pollutant identification, Pesticides, Oil pollution, Detergents, Surfactants, Water analysis, Plastics, Toxicity, Environmental effects, *Bibliographies.

An extensive review of the 1974 literature on organics in water pollution (identification, analytical procedures, treatments, sources) is presented. Topics covered included: oxygen demand and organic carbon; detergents and surfactants; oil and grease, pesticides and related chlorinated hydrocarbon compounds such as chlorinated hydrocarbon pesticides, polychlorinated biphenyls, napthalenes and paraffins, organophosphorus pesticides, carbamates and ureas, herbicides, and other pesticides; and, organic analysis of water including waste water analyses, drinking water and natural water analyses, and analyses of humic acids, organic mercury compounds, plastics, plasticizers-phthalate acid esters, taste and odor compounds, organic acids, nitrogen compounds, carcinogenic compounds, and sulfur compounds. The following information was presented in table form: toxicity and biological effect of detergents, surfactants, and detergent builders on aquatic organisms; toxicity and biological effects of petroleum contaminants on aquatic organisms; toxic effects of chlorinated hydrocarbon biocides in aquatic organisms; residuals of chlorinated hydrocarbons in aquatic related organisms; residuals of chlorinated hydrocarbons in soils and sediments; photolysis studies of chlorinated hydrocarbons; toxic effects of PCB's on aquatic related organisms; summary of studies of environmental impact of pesticides; toxic effects of herbicides to aquatic related organisms; herbicide adsorption studies, photolysis studies of herbicides; collection methods for identification of trace organics in water; and, toxicological levels and effects of mercury. **EFFECTS OF AERIAL FOREST FERTILIZATION WITH UREA PELLETS ON NITROGEN LEVELS IN A MOUNTAIN STREAM,**
Pacific Northwest Water Lab., Corvallis, Oreg.
K. W. Malueg, C. F. Powers, and D. F. Krawczyk.
Northwest Sci., Vol 46, No. 1, p 52-58. 1972.

Descriptors: *Forests, *Fertilization, *Ureas, *Nitrogen, Streams, Rainfall, Water pollution effects, *Path of pollutants.
Identifiers: Aerial fertilization, Mountain streams, Pellets.

Effects of urea pellets introduced directly into the water during the application were considered, in addition to wash-off and leaching from the adjacent forest land. Aerial application of fertilizer resulted in rapidly increased urea concentration in the water, and this was probably due to direct fallout into the water. Fertilization of the watershed immediately adjacent to the stream resulted in movement of N to the water during periods of rainfall.--Copyright (c) 1973, Biological Abstracts, Inc.

**POLLUTION OF GROUNDWATER DUE TO MUNICIPAL DUMPS,**
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
G. Hughes, J. J. Tremblay, H. Anger, and J. D'Cruz.
Water and Pollution Control, Vol 110, No 1, p 15-17, 1972.

Descriptors: *Groundwater, *Water pollution control, *Landfills, *Leachate, Garbage dumps, Gases, Regulation, Precipitation(Atmospheric), Hydrology, Surface waters, Methane, Carbon dioxide, *Water pollution sources.

Major investigations of the production and movement of dissolved solids and gases from solid waste disposal sites have been made in California and Great Britain. Other investigations have been conducted in New York, Illinois, Pennsylvania, South Dakota, West Virginia and Wisconsin. The studies revealed that a polluting leachate can be produced by refuse in contact with water, either groundwater or surface precipitation. In Britain, Illinois, and Wisconsin, investigations have demonstrated that precipitation will infiltrate refuse to produce a leachate unless measures are taken to seal the complete landfill surface. Methane and carbon dioxide, as well as dissolved solids, are produced by the refuse decomposition; the former may create explosion problems and carbon dioxide may increase groundwater hardness. The design of protective measures for otherwise unsuitable sites appears feasible and is being studied in California and Illinois. Currently regulations range from generalities to those specifying that certain physical conditions exist at the site to prevent pollution which may be unduly restrictive or hopelessly complex. The effectiveness of various types of liners, mechanisms by which contaminants are removed from leachate by natural processes, effects of slope, materials, and vegetation on infiltration into a landfill, and methods of leachate treatment require investigation. **NITROGEN TRANSFORMATION AND UPTAKE,**
Guelph Univ. (Ontario). Dept. of Land Resource Science.
E. G. Beauchamp and J. Moyer.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974 Toronto, Ontario, Canada, p 159-173. (1974) 9 fig, 10 ref

Descriptors: *Sludge disposal, *Fertilization, *Nitrogen cycle, *Crop response, Nitrification, Denitrification, Nitrogen fixation, Leaching, Groundwater, Surface waters, Absorption.
Identifiers: Land application.

Some of the more important transformations of sludge nitrogen and their importance to crops and the environment are discussed. Nitrogen is one of the limiting factors in the disposal of sewage sludges on argicultural land. The total organic N content of anaerobically digested sludges may vary between 0.1 and 0.3 on a fluid basis. The ammonium nitrogen (NH4-N) content may be between 2 and 50% of the total N. Transformations discussed include: mineralization of organic N; conversion of NH4 to NO3 via nitrification; volatilization of NH3; immobilization of organic N, NH4, and NO3 by soil microorganisms; NH4 fixation in clays; and, denitrification of NO3. The nitrification process involving the conversion of NH4 to NO3 is the most important from the point of view of crop uptake and ground or surface drainage water pollution. Sludge should not be applied in quantities which supply more available N (NH4) than the crop requires. This will prevent NO3 pollution of ground and drainage waters as well as an excessive uptake of NO3-N by plants which could be harmful to ruminants. (See also W75-11715) (Orr-FIRL)
W75-12136

**RUNOFF AND EROSION LOSSES,**
W. E. Curnoe.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 174-184. (1974) 6 tab, 2 ref.

Descriptors: Runoff, Erosion, Sludge, Clay loam, Nutrients, Heavy metals, Precipitation(Atmospheric).
Identifiers: Soil conditions, Experiments.

Experiments were conducted to determine nutrient and heavy metal losses through runoff and erosion. The experiments began in the fall of 1972 and were conducted through the spring of 1974. The soil was a sandy clay loam with tile drains on a 2% and 6% slope. The sludge was applied in November, January, and May. Water was collected and measured and samples were taken for analysis after each runoff. Precipitation patterns and runoff events are directly related. The experimental period had a precipitation rate slightly above average. The highest nitrogen loss occurred during the winter months. The sludge application time did not seem to affect the phosphorus loss which was low. Heavy metal losses were also generally low. The conclusions were: before applying sludge, weather probabilities, snow cover, and soil conditions should be considered; application rates can increase nutrient runoff and should be restricted; and the amount of metal in the sludge has an effect on the amount of heavy metal loss. escriptors: *Sludge disposal, *Fertilization, Soil science, *Cations, *Soil profiles, Soil orizons, Soil moisture, Soil physical properties, oil structure, Path of pollutants.

esearch being conducted at the University of uelph, Ontario on the land disposal of sewage udge includes a study to demonstrate variation of oils at the macro (field plot) and micro (cation) cales. This type of data will be included in the evelopment of final guidelines for soil sampling nd analyses. Clay content influences the pH and ariability of CaCO3 content by influencing the mount of water passing through the soil. The otential maximum variability of cations in a soil is emonstrated with two profiles 12 inches apart in oarse textured soils. This variability is caused by he inherent fluvial parent material and the in-uence of trees on soil formation. Distribution of ations within the soil profile is under the ultimate ontrol of their solubility products, porosity of the oil, and the micro variations in the soil moisture egime. The "final" distributions of cations within he soil on the microscopic scale are illustrated by iicrographs of the different pedological recipitates and concretions found in soils. In rder to dispose of waste on agricultural land for ood production under environmentally safe con-itions, it is necessary to understand the variabili-y of cations in soils to accurately monitor the ystem. Identifiers: *Offshore dumping, *New York Bight, Physical oceanography, Geological oceanography, Chemical oceanography, Bottom sediments, Tidal currents, Nutrient distributions, Bight wastes, Bight waters.

This report deals with the offshore dumping in the New York Bight, primarily its physical, geological, and chemical oceanographic effects. Physically, the analysis shows two distinct circulation regimes. (1) near the harbor mouth and along the New Jersey coast, New York Harbor discharge flows southward parallel to the New Jersey coast; at depth, there is a return flow of external water into the estuary. (2) Outside the region of strongest influence from river discharge, a persistent clockwise circulation or eddy appears to exist. Geologically, fine-grained waste dumped in New York Bight is entrained in a clockwise circulation pattern and is dispersed to the north. A significant portion is deposited in the low area (Christiaensen Basin) immediately northwest of the dumpsites. Chemically, the data from water sampling show that nutrient (nitrates, silicates, and phosphates) distributions are dominated by the lower New York Bay outflow, with dumped sewage sludge contributing very small amounts. Bottom grab samples were analyzed for total organic carbon and total carbohydrates. (NOAA)

The New York Bight extends seaward over 15,000 square miles from Long Island and New Jersey to the edge of the continental shelf, some 80-100 nautical miles offshore. Wastes from 20 million people are discharged to the Bight. These wastes arrive by a variety of routes: ocean dumping, outfall sewers, air pollution, river discharge, land runoff, thermal discharges, vessel wastes, and occasional spills. Although impacts of these wastes on the marine environment are not clearly understood, there is evidence that the waters, bottom sediment, and living resources are under stress. In 1973 the amount of raw and digested sewage sludge was 150 million ft 3 (4.3 x 106 m3). An average of 260 million ft3 (7.4 x 106 m3) per year of dredge spoils were dumped each year between 1965 and 1970, as well as waste acid, and construction and demolition debris. The hazards of this dumping are not known, however above normal incidence of fin-rot disease in fish in the area and the closing of the area to shellfishing are indictions that something is wrong. However, there is no evidence of massive shoreward movement of the sludge, or of imminent bacteriological hazard to the beaches. It is recommended that land-based disposal alternatives be developed. (NOAA)

REPORT TO THE CONGRESS ON OCEAN DUMPING RESEARCH, JANUARY THROUGH DECEMBER 1974 PUBLIC LAW 92-532, TITLE II, SECTION 201.
National Oceanic and Atmospheric Administration, Washington, D.C.
Available from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 for $1.10. June 1975. 48 p, 6 fig, 1 tab, 27 ref.

Descriptors: *Oceans, *Sewage sludge, *Water pollution, *Water pollution effects, *Water pollution treatment, *Waste disposal, Wastes, Disposal, Waste treatment, Dredging, Water law, Dredging, Sewage, Industrial wastes, Aquatic environment, Pollutants, Marine geology, Path of pollutants.
Identifiers: *Ocean dumping, Sewage dumping, New York Bight, Waste materials, Dredged materials, Nondredged materials, Geological oceanography, Physical oceanography, Chemical oceanography, Biological oceanography, Dump sites, Ocean disposal.

This is the second annual report submitted to Congress on the federally sponsored research on the effects of ocean dumping, as required under Section 201. The report describes significant Federal research programs and activities carried out in 1974. It also includes a summary of 1974 studies relative to the requirements of Section 203. It contains sections on research on ocean disposal of dredged and nondredged material, dumpsite characterizations, Coast Guard R and G for ocean dumping surveillance and enforcement, dredged material disposal in the Great Lakes, and research on alternatives to ocean dumping. During 1974 approximately 130 million tons of material were dumped in U.S. coastal waters. Dredged material accounted for 118 million tons, or over 90% of the total tonnage dumped in 1974. This amount was twice the dredged material deposited in the ocean in 1973. The increase was due to extensive flooding and silting in the Mississippi River basin in recent years. Dredged material is an environmental concern because of the large quanitities involved and the presence of contaminated sediments. The ocean disposal of wastes other than dredged materials occurs mainly in the New York Bight. (ETJA)

THE MUSSEL WATCH--A FIRST STEP IN GLOBAL MARINE MONITORING,
Scripps Institution of Oceanography, La Jolla, Calif.
E. D. Goldberg.
Marine Pollution Bulletin, Vol 6, No 7, p 111, July 1975, 5 ref.

Descriptors: *Mussels, *Monitoring, *Bioindicators, Oceans, Coasts, Water Pollution Sources, Pollutant Identification, Heavy Metals, Halogenated pesticides, Oil, Laboratory studies, Economics, Pollutant identification.
Identifiers: Transuranics, Bioaccumulation.

A world mussel watch (using e.g. Mytilus edulis) of specimens from 100 coastal and open ocean sites was suggested. Mussels, which are especially

suitable for measuring pollutant levels, would be analyzed for their concentrations of halogenated hydrocarbons, transuranics, heavy metals and petroleum. This project was presented as economically reasonable. (Katz)

**ACTIVITY OF ENZYMES (PROTEASE AND UREASE) AND FORMS OF MOBILE NITROGEN IN THIN PEAT SOIL OF THE SECOND YEAR OF USE, (IN RUSSIAN),**
Akademiya Navuk BSSR, Minsk. Inst. of Experimental Botany.
T. A. Shcharbakova, H. Ya. Korabava, and S. M. Barodz'ka.
Vyestsi Akad Navuk B SSR syer Biyal Navuk, No 1, p 47-54, 1973.

Descriptors: *Enzymes, *Nitrogen, *Peat, Potatoes, Soils, Crop production, Grasses, Mineralogy, Hay, Water pollution sources, *Path of pollutants.
Identifiers: Mineralization, *Protease, *Urease.

The thin peat soil with a groundwater level at a depth of 80-120 cm displayed a high urease and proteolytic activity. The appreciable accumulation of mobile N substances produced high yields of potatoes and hay of perennial grasses. Ammonia N was the predominant form of mobile N. In most cases a direct correlation was observed between urease activity and total content of mobile N. Mineralization processes of the organic N-containing substances in the peat soil occurred more intensely during cultivation of potatoes in comparison with perennial grasses. The activity of enzymes and accumulation of mobile N substances in the drained bog were at a level close to cultivated soils.--Copyright 1974, Biological Abstracts, Inc.

**SALT RECOVERY SYSTEM,**
B. Keilin, and J. M. Hebert.
US Patent No 3,899,421, 8 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 937, No 2, p 631-632, August 12, 1975.

Descriptors: *Patents, *Water softening, *Water quality treatment, *Water pollution treatment, *Water pollution sources, *Water pollution control, Cleaning, Equipment, Recycling.
Identifiers: Backwash.

During a resin regeneration cycle of water softeners the effluents are sent to the sewer with the result that not only does a considerable amount of salt go to waste but also the salt adds to the pollution in the waste water. In this invention the recovery of salt is accomplished by selectively bleeding off the high salt content portion of the effluent passing through the drain line of an automatic water softener and collecting it for reuse or selective disposal, while permitting those portions of the effluent stream containing little or no salt to pass to waste. The salt recovery system includes sensing means for the detection of high salt concentration in the effluent stream passing a given point adapted to actuate a diverter valve in the drain line to shunt the flow of effluent through a downpipe and into a collecting tank. This is accomplished by means of circuitry containing a conductivity cell, a relay and a solenoid. The collecting tank for the diverted salt solution is an evaporator tank fitted with a float-actuated immersion heater. When the liquid in the tank reaches a predetermined level, it moves a float into position to close the heater circuit and an immersed heater element comes on to heat the liquid. (Sinha-OEIS)

**THE IMPACT OF CHEMICAL POLLUTION ON WATER UTILIZATIONNUTZUNG),.**
**(CHEMISCHE GEWAESSERVERUNREINIGUNG UND WASSER**
Karlsruhe Univ. (West Germany). Carl Engler-und Hans-Bunte-Institut fuer Mineraloel-und Kohleforschung.
H. Sontheimer.
Schweizerische Zeitschrift fuer Hydrologie, Vol 37, No 1, p 118-134, June, 1975. 9 fig, 3 tab, 12 ref.

Descriptors: *Water quality control, *Analytical techniques, *Water pollution sources, *Industrial wastes, *Organic compounds, Chemical oxygen demand, Chemical analysis, Biological treatment, Waste discharge, Waste water treatment.
Identifiers: *Rhine River, Physico-chemical treatment, Refractory compounds.

Potable water from natural reservoirs is threatened by pollution by synthetic chemicals. The Rhine river is described; its lower reach is enriched with refractory organic compounds which are the result of self-purification of industrial pollution from the upper part of the river. Changes in water composition are detected by various analytical methods, such as the quantitative determination of individual substances or groups of substances. In addition, methods have been applied which indicate the organic content by overall parameters such DOC, COD, or UV-extinction. Studies in the winter of 1971-1972 indicated that refractory compounds in industrial waste water should be eliminated by physico-chemical techniques in addition to the conventional biological treatment before discharge to the river. **STUDIES OF PREVENTION OF WATER POLLUTION, III. ON THE BIODEGRADATION OF SYNTHETIC DETERGENTS, (IN JAPANESE),**
O. Sakaguchi, K. Yokota, and S. Takashita.
Eisei Kagaku, (Jour of Hygienic Chemistry), Vol 21, No 2, p 51-54, 1975. 4 fig.

Descriptors: *Biodegradation, *Detergents, Alkylbenzene sulfonates, Water pollution, Sewage, Municipal wastes, Aerobic conditions, Anaerobic conditions.

The biodegradation of synthetic and commercial detergents has been examined at various conditions. Domestic sewage was incubated at 30 degrees, to study the degradation of linear alkyl benzenesulfonate (LAS) and alkyl benzenesulfonate (ABS). Twenty ppm LAS degraded easily and was about 50% consumed after seven days under aerobic conditions, but was only slightly degraded under anaerobic conditions. On the other hand, the higher fatty acid ABS was easily biodegraded under both aerobic and anaerobic conditions after one day. Biodegradation of LAS was delayed in the presence of nutrients. When detergent-grown cells separated from domestic sewage were observed, they showed two optimal peaks of 2,3,5-triphenyltetrazolium chloride (TTC) reduction activities at pH 7.0 and 8.5. ## 5C. Effects Of Pollution

**TOXICITY OF COPPER COMPLEXES TO RFRESHWATER MOLLUSKS,**
V. T. Kapkov.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-763 967, $3.25 in paper copy, $2.25 in microfiche. ranslation FSTC-HT-23-1987-72, March 1973. Translated from Prochvoved, Vol. 26, No. 2, 1971. 5 p.

Descriptors: *Mollusks, *Freshwater, *Copper, *Copper compounds, *Toxicity, *Spectrophotometry, Gastropods, Separation techniques, Antifouling materials, Aquatic environment, *Pollutant identification, Water pollution effects.
Identifiers: Copper pyridinates, *Copper complexes, Pyridine complexes, Alpha-beta-picoline, 2,6-lutidine, ligands.

The toxicity of some complex compounds of copper with pyridine and its homologues on freshwater mollusks was evaluated. The pyridine complexes evaluated were Alpha, Beta-picoline, and 2-,6-lutidine in concentrations of 0.01-5.0 mg Cu in one liter. Contents of copper in the water and in the organic mollusks was determined spectrophotometrically using a SF-4a spectrophotometer with sodiumdiethyldithiocarbamate in the presence of a citrate-versene mixture at a pH of 8.0 with subsequent extraction of the stained complexes with carbon tetrachloride. Alpha-picoline-copper and 2,6-lutidine of copper exerted a less toxic effect than cupric chloride. The toxicity of dichloropyridinecopper and a complex of copper with Beta-picoline was higher in all experiments than the toxicity of CuC12 in the same concentrations. In concentrations less than 0.1 mg Cu in one liter, neither the copper complexes tested nor the CuC12 led to the death of bivalve mollusks tested 30 days. In all experiments gastropod mollusks were more resistant to the effects of the toxicants than bivalve mollusks. (Delfiner-Vanderbilt)

**EFFECTS OF OILFIELD BRINE ON MARINE ORGANISMS, AN ECOLOGICAL EVALUATION OF THE ARANSAS BAY AREA, JOB NO. 1,**
Texas Parks and Wildlife Dept., Austin.
T. L. Heffernan, J. Monier, and S. Page.
In: Coastal Fisheries Project Report 1971, p. 209-212, 6 ref.

Descriptors: *Crabs, *Shrimp, *Crustaceans, *Brines, Saline Water, Drilling Fluids, Lethal Limits, *Toxicity, Laboratory Tests, Water Quality, Chemical Analysis, Environmental Effects, Water pollution effects, *Texas.
Identifiers: *Brown Shrimp, *Blue Crabs, Penaeus aztecus, Callinectes sapidus, Sublethal Concentrations, LC-50, *Aransas Bay(Texas).

Toxicity studies were made of oilfield brine from two separator locations in conjunction with the Sinton oilfields: Haas' Ditch, emptying into Chiltipin Creek, and Southwestern Oil and Refinery emptying into Copano Bay. Salinity of this brine ranged from 82.4 to 91.6 parts per thousand. Mortalities were noted in all tests using brown shrimp (Penaeus aztecus), white shrimp (Penaeus setiferus), and juvenile blue crabs (Callinectes sapidus). Brine concentrations of above 40 per cent produced 100 per cent mortalities on all species tested. (Katz)

TUDIES ON EFFECTS OF CERCARIAL CONENTRATION AND LENGTH OF EXPOSURE N INFECTION OF MICE BY ST. LUCIAN CHISTOSOMA MANSONI CERCARIAE IN A ATURAL RUNNING-WATER HABITAT,
int Lucia Research and Control Dept., Castries.
S. Upatham.
rasitilogy, Vol 68, No 2, p 155-159, 1974.
entifiers: *Cercariae, Cercarial concentration, xposure, Habitat, *Human infection, Mice, atural, Running, *Schistosoma-mansoni, St-Lun(West-Indies), Water pollution effects.

he effects of cercarial concentration and length exposure on the infection of mice by St. Lucian Vest Indies) S. mansoni cercariae were instigated in a running-water habitat. For all expore times, mice exposed to cercarial concentraons from 2.5-40 cercariae/mouse acquired no inctions. At higher concentrations, infection rates d worm burdens of mice increased in direct proortion to cercarial concentrations and exposure nes. The highest infection rate (57.9%) and worm rden (46 worms) were obtained in mice exposed r 256 min to 1280 cercariae/mouse. Cercarial ncentrations are low in St. Lucian running aters, a fact suggesting that the risk of persons coming infected while fording, collecting omestic water, washing clothes and swimming in abitats with reasonable flows is very low. Most fected individuals probably acquire a low worm rden over a rather long period of time.--Copyght 1974, Biological Abstracts, Inc.

EHAVIOURAL RESPONSES OF WHITEFISH ND RAINBOW TROUT TO DRILLING LUIDS,
sheries and Marine Service, Winnipeg Manitoba).
. Lawrence, and E. Scherer.
echnical Report No 502, 1974. 47 p, 14 fig, 3 tab, ref.

escriptors: Biology, Pollution, *Environmental fects, *Drilling fluid, *Rainbow trout, Offshore atform, Sodium compounds, *Fish behavior, cology, Habitats, Persistence, *Water pollution fects.
entifiers: *Whitefish, Lignosulfates, Barite, odium hydroxide.

ehavioral responses of whitefish (Coregonus clueaformis) and rainbow troup (Salmo gairdneri) to illing mud (1 to 1000 ul/l) and its supernatant action (55 to 10,000 ul/l) were tested in laboratory experiments. Experiments were run under inared as well as under visible light, to separate notically from chemically elicited responses. our response parameters were recorded and nalysed: (1) percent test time spent in pure comared to contaminated water, (2) effect of contact ith contaminant on swimming speed, turning te, and frequency of movements across the centrline of the test chamber (boundary between ure and contaminated water), (3) extent of enetration by fish into pure vs contaminated ater, (4) time spent at the end walls of the pure vs ontaminated water side. Conclusions on reference or avoidance are derived from these ehavioral elements. The results are discussed ith regard to LC50 values of drilling fluids. Both hitefish and rainbow trout showed preference r mud suspensions at the maximum concentraon tested, namely 1000 ul/l; this value represents 04 and 0.013 of the 96 hr LC50 for whitefish and inbow, respectively. In tests with supernatant, oth species showed a shift in their reaction from reference at 1000 ul/l toward avoidance at 10,000 /l. These two values equal 0.02 and 0.2 of a conentration still found to be non-lethal to whitefish a static bioassay lasting 28 days. (Bradbeer-WWA)

A COMPUTER PROGRAM USED TO ESTIMATE PRIMARY PRODUCTIVITY FROM PH AND CARBON DIOXIDE DATA EMPLOYING THE UPSTREAM-DOWNSTREAM METHOD,
Battelle-Pacific Northwest Labs., Richland, Wash.
E. G. Wolf, and R. J. Olson.
Available from the National Technical Information Service, Springfield, Va 22161 as BNWL-1828, $4.25 in paper copy, $2.25 in microfiche. BNWL-1828, May 1974. 24 p, 7 ref. AEC AT (45-1)1830.

Descriptors: *Computer programs, *Primary productivity, *Streams, Hydrogen ion concentration, Carbon dioxide, On-site investigations, Estimating equations, Data collections, Upstream, Downstream, Respiration, Streamflow.

A computer program to estimate primary productivity was adapted using the upstream-downstream method and conversion of pH to carbon dioxide in lotic systems. The program was modified to include multiple station sampling and interpolate readings that did not occur at hourly intervals. It utilizes mathematical equations fitted to carbon dioxide-pH conversion data. To apply the formula for estimating productivity to computer analysis, pH values were read in and converted to millimoles carbon dioxide; downstream pH values were offset by average flow time; accural correction was used to adjust upstream or downstream carbon dioxide values to account for any carbon dioxide addition to the area; millimoles carbon dioxide/l were converted to grams carbon dioxide/sq meter; carbon dioxide values were corrected for diffusion and downstream carbon dioxide was subtracted from upstream values and divied by average flow time. This yielded positive values representing grams/hour community respiration and negative values representing grams/hour net productivity. The program integrates respiration and productivity values yielding daily values, average productivity, respiration per hour, integration of data annually, and total productivity of stream discharge volume per hour. The program was written for a UNIVAC 1108 computer using the FORTRAN level 5 language. (Buchanan-Davidson-Wisconsin)

COMPARATIVE SURVIVAL OF ENTEROCOCCI, COLIFORMS AND SALMONELLAS IN WATER, (IN RUSSIAN),
Institute of General and Municipal Hygiene, Moscow(USSR).
G. G. Kalina.
Gig Sanit, Vol 5, p 102-104, Illus, 1974.

Descriptors: *E. coli, *Coliforms, *Salmonella, Rivers, *Streptococcus, Microorganisms, Enteric bacteria, Bioindicators, Mortality.
Identifiers: Enterococci, Escherichia-coli, Escherichia-freundii, Fecal, Salmonella-typhi, Salmonella-typhimurium, Streptococcus-faecalis, Streptococcus-faecium.

Data is presented on the survival of enteroccoci, coliforms and salmonellas (Streptococcus faecalis, Streptococcus faecium, Salmonella typhimurium, Salmonella typhi, Escherichi coli, Escherichia freundii) in river water. The ability of these organisms to multiply and survive in river water depended on the experimental methods and condition of the microorganisms used in the experiment. S. faecalis, dying more quickly in water than S. faecium, can indicate fresh fecal contamination with greater reliability than the enterococci.--Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF THE COMMERCIAL POLYCHLORINATED BIPHENYL MIXTURE AROCLOR 1242 ON GROWTH, VIABILITY, PHOSPHATE UPTAKE, RESPIRATION AND OXYGEN EVOLATION IN SCENEDESMUS,
Stockholm Univ. (Sweden). Botany Inst.
C-M. Larsson, and J-E. Tillberg.
Physiologia Plantarum, Vol 33, No 4, p 256-260, 1975. 3 fig, 2 tab, 37 ref.

Descriptors: *Plant physiology, *Inhibition, *Aroclors, *Algae, Polychlorinated biphenyls, Viability, Chlorophyta, Phosphates, Respiration, Pesticides, Absorption, Food chains, Oxygen.
Identifiers: *Scenedesmus obtusiusculus, Aroclor 1242, Phosphorylation, PCB.

To gain knowledge about physiological responses of microalgae to polychlorinated biphenyls, the unicellular green alga Scenedesmus obtusiusculus was grown in liquid media containing the commercial PCB mixture, Aroclor 1242 (10-1000 ppb). The algae did not respond to PCBs even in very high doses if they were added just before the experiment, so the algae were cultured in PCBs before the experiment. Growth was inhibited at 300 ppb and above and viability was only affected at 1000 ppb. Inhibition of phosphate uptake had almost the same appearance in light as in darkness, and may be largely caused by PCB action on the plasmalemma. Lower inhibiting concentrations did not affect oxygen uptake or oxygen evolution in light. At 800 ppb some experiments indicated an upcoupling of oxidative phosphorylation and induced an increased respiration rate, but at 1000 ppb respiration was inhibited and oxygen output reduced. Although the PCB concentrations discussed are higher than those normally found in natural waters, it would not be impossible for some of these effects to occur under natural conditions, resulting in disturbance of basic food production in aquatic ecosystems. (Buchanan-Davidson-Wisconsin)

N AND P DISTRIBUTION IN LAKE KINNERET (ISRAEL) WITH EMPHASIS ON DISSOLVED ORGANIC NITROGEN,
Israel Oceanographic and Limnological Research Ltd., Haifa.
C. Serruya, U. Pollingher, and M. Gophen.
Oikos, Vol 26, No 1, p 1-8, 1975. 7 fig, 4 tab, 26 ref.

Descriptors: *Nitrogen, *Phosphorus, *Eutrophication, Subtropic, Nitrogen cycle, Ammonification, Denitrification, Nitrogen compounds, Plankton, Lake sediments, Anaerobic conditions, Fluctuations, Seasonal, Turnovers, Chelation, Distribution.
Identifiers: *Lake Kinneret(Israel), *Israel, Dissolved organic nitrogen, Peridinium cinctum, Nitrogen sources.

Fluctuations in the amount and distribution of different forms of nitrogen and total phosphorus and the role of dissolved organic nitrogen in the nitrogen cycle were studied in Lake Kinneret, Israel. Organic nitrogen originates from the watershed, plankton, and sediments. The high nitrogen input was compensated by denitrification during the anoxic period. Phosphorus concentration was limited by chemical equilibria. A dense dinoflagellate bloom develops in winter-spring. Distributions of nitrogen and phosphorus showed that lake water was the largest nitrogen pool, and sediments were the main phosphorus reservoir. There were seasonal and vertical fluctuations in dissolved organic nitrogen. Cell autolysis after the bloom released large amounts of dissolved organic nitrogen into the upper water layers. Another fraction sedimented and remained unchanged during the anoxic period. At the next turnover, the oxidative process produced more disssolved organic nitrogen which ammonified rapidly. Delay in ammonification and dissolved organic nitrogen accumulation may retard Peridinium cinctum bloom, probably because of the chelating effect of dissolved organic nitrogen. Large amounts of phosphorus are stored in sediments but relatively small amounts are released under anoxia, but phosphorus represents a potential danger of eutrophication. Minor lake level modifications may affect factors controlling storage and release

of phosphorus in sediments. (Buchanan-Davidson-Wisconsin)
W75-11975

**RESPONSE OF LAKE SUPERIOR ALGAE TO NUTRIENTS AND TACONITE TAILINGS,**
Texas Univ. at Dallas, Richardson. Inst. for Environmental Sciences.
R. H. Plumb, and G. F. Lee.
Journal Water Pollution Control Federation, Vol 47, No 3, p 619-629, 1975. 1 fig, 3 tab, 7 ref.

Descriptors: *Algae, *Eutrophication, *Lake Superior, *Nutrients, Phosphates, Carbon, Trace elements, Manganese, Magnesium, Zinc, Nitrates, Silica, Toxicity, Minnesota.
Identifiers: *Taconite tailings, *Reserve Mining Co., Silver Bay(Minn).

To determine the algal-limiting nutrients in Lake Superior, whether the limiting nutrient changes with time, the stimulation potential of taconite tailings, and algal response to taconite tailings at different times of the year, a nutrient spiking study was made primarily in the western arm of Lake Superior from November 1971 to May 1973. Approximately 70-80% of all samples receiving phosphate in the study had a greater rate of carbon fixation. Trace metals (magnesium, copper, boron, iron, zinc, cobalt, molybdenum) stimulated 20% of the samples and manganese 8%, but nitrate and silica did not stimulate algal populations in Lake Superior. No seasonal fluctuations were observed in the responses of algae to nutrient spiking. Additions of taconite tailings did not stimulate the algae. Less than 5% of the tailings suspensions produced a net carbon fixation that was greater than that of lake water controls. It was concluded that Lake Superior algae will respond to phosphate additions. The fact that the algae responded to tailings plus phosphate but not to tailings along suggests that tailings do not contribute to eutrophication of the lake and that taconite tailings are not toxic to algae. (Buchanan-Davidson-Wisconsin)

**PRIMARY PRODUCTION IN THE PLANKTON COMMUNITY OF A TROPICAL LAKE,**
Savannah River Ecology Lab., Aiken, S.C.
W. M. Lewis.
Ecological Monographs, Vol 44, No 4, p 377-409, 1974. 13 fig, 12 tab, 82 ref NSF GB 16054, AEC AT (38-1)310.

Descriptors: *Tropical regions, *Plankton, *Primary productivity, *Lakes, Weather, Water chemistry, Light penetration, Standing crops, Distribution, Fluctuations, Photosynthesis, Inhibition, Mixing, Stratification, Euphotic zone, Seasonal, Nutrients.
Identifiers: *Lake Lanao(Philippines), Philippines.

Primary production, weather, chemistry, light penetration, and standing crop studies of autotrophs and heterotrophs were made of Lake Lanao, Philippines. Diurnal rhythms in photosynthetic efficiency per lake surface area were not observed. Vertical profiles of photosynthesis exhibited light inhibition except on overcast days. Inhibition threshold at the surface was lower in windy than calm weather. The mean inhibition threshold one meter or more deep was lower than at the surface. The lake was exceptionally transparent considering its high productivity and had a vertical dispersion of production due to low amounts of dissolved and suspended matter in the euphotic zone, high production per unit of standing crop, and extensive mixing in the upper water column. Autotrophs accounted for 80% of euphotic zone respiration. Seasonal variations were related to resource supply rather than to temperature or biomass removal. Incident light accounted for 12-30% of seasonal production variations. Light was limited by thickening of mixing zone during the circulation periods and storms. Nutrient supply was the dominant controlling factor during stratification. Nutrient depletion was relieved by changes in mixing depth during storms. High sustained production on a low nutrient base in explained by rapid nutrient transfer from the decomposition zone to the euphotic zone. (Buchanan-Davidson-Wisconsin)

**CLASSIFICATION OF WISCONSIN LAKES BY TROPHIC CONDITION.**
Wisconsin Dept. of Natural Resources, Madison. Bureau of Water Quality.
Report April 15, 1975. 108 p, 3 tab, 18 append.

Descriptors: *Wisconsin, *Lakes, *Trophic level, *Classification, Water pollution, Legislation, Rehabilitation, Pollution abatement, Protection, Nuisance algae, Aquatic weeds, Winterkilling, Financing, Planning, Monitoring, Water management(Applied).
Identifiers: Inland Lakes Renewal Program.

In compliance with the 1972 Federal Water Pollution Control Act Amendments, all publicly owned, named lakes of all sizes, and unnamed lakes 20 acres or larger in Wisconsin are listed. There are 14,977 tabulated lakes covering 947,384 acres. Four different classifications schemes are discussed. Of 1,153 lakes 100 acres or larger, 335 (29%) covering 402,157 acres show signs of eutrophication (winterkill, pollution, nuisance algae, macrophyte problems), while 818 (71%) covering 367,504 acres did not. Another survey of 1,130 Wisconsin lakes (mostly 100 acres or larger) classified 28 lakes (2%) very oligotrophic, 308 (27%) oligotrophic, 586 (52%) mesotrophic, 158 (14%) eutrophic, and 50 (4%) very eutrophic. Seven appendices discuss techniques and experiences in developing methods and procedures for lake protection and rehabiliation in Wisconsin. Six appendices describe the various Wisconsin programs associated with lake classification and management. Also included are copies of the Wisconsin Inland Lake Protection and Rehabilitation Law and Administrative Rules for feasibility studies and project planning and implementation. (Buchanan-Davidson-Wisconsin)

**THE UPTAKE AND UTILIZATION OF ORGANIC CARBON BY ALGAE: AN ESSAY IN COMPARATIVE BIOCHEMISTRY,**
Stockholm Univ. (Sweden). Arrhenius Lab.
A. H. Neilson, and R. A. Lewin.
Phycologia, Vol 13, No 3, p 227-264, 1974. 8 tab, 324 ref.

Descriptors: *Organic compounds, *Absorption, *Carbon, *Algae, *Biochemistry, *Metabolism, Reviews, Light, Lipids, Nitrogen, Amino acids, Chlorophyta, Cyanophyta, Carbon dioxide, Bacteria, Respiration, Photosynthesis, Alcohols, Carbohydrates, Mode of action, Nutrient requirements, Plant growth substances.
Identifiers: *Heterotrophic algae, *Organic carbon, Acetate, Fatty acids, Obligate photolithotrophy, Glycollate, Glycerol, Hexose, Pentose, Pyrimidine, Purine.

Organic compound uptake and utilization by algae in light and dark is reviewed and the mode of action compared with bacteria. No algae grows under anaerobic conditions or heterotrophically using only carbon compounds. Many assimilate exogenous acetate into lipids in light and dark. Some grow heterotrophically using saturated fatty acids. Obligately photolithotrophic algae incorporate long-chain fatty acids into lipids without prior degradation. Some assimilate glycollate in light. Glycerol is a substrate for many in light and dark. Hexoses are also used for heterotrophic growth. Pentoses inhibit growth of many algae in light, but ribose and xylose support heterotrophic growth of some green and blue-greens. Amino acids are used as nitrogen sources by several algae for growth in light and sometimes improve heterotrophic growth in dark. Pyrimidines and purines do not support heterotrophic growth, but uracil, uric acid, and adenine can be nitrogen sources for growth of green and blue-green algae in light. Hypotheses to explain obligate photolithotrophy are discussed. No single explanation reconciles the reasons why many algae which grow in light using carbon dioxide cannot grow heterotrophically in dark. Generally heterotrophic algae have too low an affinity for most substrates to compete effectively with bacteria under natural conditions. (Buchanan-Davidson-Wisconsin)

**GEOCHEMISTRY AND NUTRIENT REGIME OF SALINE EUTROPHIC LAKES IN THE ERICKSON-ELPHINSTONE DISTRICT OF SOUTHWESTERN MANITOBA.**
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
Technical Report No 511, 1975. 86 p, 24 fig, 19 tab, 86 ref, 1 append.

Descriptors: *Geochemistry, *Nutrients, *Eutrophication, *Saline lakes, *Canada, Chemical properties, Ice cover, Salinity, Ions, Sodium, Potassium, Magnesium, Manganese, Calcium, Iron, Chlorides, Sulfates, Hydrogen ion concentration, Specific conductivity, Seasonal, Fluctuations, Water properties, Dissolved oxygen, Hydrogen sulfide, Nitrogen, Phosphorus, Carbon, Silica, Plankton, Biomass, Chlorophyll, Fishkill, Amonia, Aquaculture, Winterkilling.
Identifiers: *Manitoba, Summerkill.

A chemical characterization of prairie winterkill lakes of the aquaculture experimental area in the Erickson-Elphinstone district, southwestern Manitoba, is presented. The 79 saline winterkill pothole lakes studied showed variability in salinity and ionic composition: total ions 268-9720, sodium 1.6-980, potassium 11.2-248, magnesium 9-1236, calcium 28-336, iron 0-0.18, manganese 0-2.14, chloride 1-191, sulfate 12-6571 mg/l. The pH varied 7.4-9.6; and specific conductance 305-7837 micromhos/cm. Of these lakes, 44.4% belonged to the true sulfate-magnesium type; 16.7% to the intermediate sulfate-bicarbonate, magnesium type; 11.1% to the intermediate sulfate-bicarbonate, magnesium-calcium type; and 27.8% to intermediate and mixed types. Seasonal variations in water composition were observed. Fifty-one lakes used for summer fish farming were monitored for dissolved oxygen, hydrogen sulfide, nitrogen, phosphorus, carbon, silica, and plankton biomass (as particulate carbon, nitrogen, phosphorus, and chlorophyll-a). Winterkill and summerkill anoxic conditions were studied. Summer fish kills occurred in lakes with chlorophyll-a concentrations exceeding 100 micrograms/l and specific conductance between 800-2000 micromhos/cm. Correlation between winter maxima of ammonia-nitrogen and chlorophyll-a maxima the following summer was found. Major nutrient sources in lake basins were evaluated. (Buchanan-Davidson-Wisconsin)

**ENDOCYTOSIS OF MICROCYSTIS AERUGINOSA BY OCHROMONAS DANICA,**
Texas Univ. at Austin. Dept. of Botany.
G. T. Cole, and M. J. Wynne.
Journal of Phycology, Vol 10, No 4, p 397-410, 1974. 27 fig, 68 ref.

Descriptors: *Algal control, *Ochromonas, *Chrysophyta, *Algae, Diets, Cyanophyta, Cytological studies, Digestion, Biocontrol.

ifiers: *Endocytosis, *Microcystis aeru-
a, Ochromonas danica, Cannibalism.

omonas danica Prings. is a chrysomonad alga
shows a high degree of nutritional versatili-
d is capable of feeding on the toxic blue -
alga, Microcystis aeruginosa Kuetz. Light
scopic, electron microscopic, and
hemical examinations of endocytosis in
omonas showed engulfment of M. aeruginosa
ubsequent digestion. Contact occurred at the
or end of Ochromonas. Two kinds of
les formed. M. aeruginosa was enclosed by a
ry food vacuole or primary endosome, which
diately began to migrate toward the posterior
f the cell causing lateral distension. This pri-
endosome soon fused with the posterior food
le or secondary endosome and released its
nts into this digestive organelle. Six or eight
ruginosa cells can accumulate in the secon-
ndosome until Ochromonas become spheri-
shape. Digestion occurs in the secondary en-
e and M. aeruginosa is completely broken
The greatest rate of endocytosis occurred
the first nine minutes after combining the
ganisms. Onset of endocytosis had a disrup-
ffect on the anterior microtubule nucleating
The chrysomonad was cannibalistic but also
appetite for many different kinds of organ-
This alga could be used to develop a
nism of biological algal control. (Buchanan-
son-Wisconsin)

norganic compounds.
iers: Phosphorus sources.

dy the availability of phosphorus in muds
ytoplankton growth, muds were prepared
welve soil types and used as the only
orus source for growth of Scenedesmus
hus. Some muds supported as much algal
as was obtained with 0.075 to 0.5 mg P/l
ittle or no growth occurred with cultures
ther muds. When the soils were extracted
phosphorus-free nutrient solution, a mix-
hydrochloric acid and sulfuric acids, a solu-
sulfuric acid and potassium sulfate, or a
n of hydrochloric acid and ammonium
e, it was shown that soils differed primarily
quantity of phosphorus present rather than
ms of phosphorus present. The soils con-
various proportions of iron, aluminum, and
phosphates. Additions of phosphorus to
s prior to their use as mud increased the
ity of some as phosphorus sources but in
oils the added phosphorus was so tightly
that little or no phosphorus was available
imorphus growth. The type of soil in a pond
ly have a large influence on the efficiency
ization with phosphate fertilizers to sustain
ankton growth in fish ponds. (Buchanan-

**FFECT OF HYDROGEN IN CONCEN-ONS IN SIMULATED RAIN ON THE TORTULA RURALIS (HEDW.)SM,**
a Univ., Missoula. Dept. of Botany.
eridan, and R. Rosenstreter.
gist, Vol 76, No 1, p 168-173, Illus, 1973.

Descriptors: *Chlorophyll, *Hydrogen ion concentration, Simulated rainfall, *Mosses, Photosynthesis, Respiration, Sulfuric acid, Oxygen.
Identifiers: *Tortula-ruralis.

Gametophores of T. ruralis were treated with sulfuric acid solutions at pH values of 1.0-6.0. The concentration of chlorophylls a + b decreased between pH6 and pH3 followed by a more rapid decline between pH3 and pH1. Chlorophyll a was more sensitive to acid than chlorophyll b. Oxygen production based on chlorophyll was relatively unaffected between pH6 and pH2, whereas photosynthesis based on dry weight decreased uniformly in relation to decrease in pH. Respiration was insensitive to pH values as low as pH2. Simulated acid rain appeared to effect a reduction in photosynthesis largely through acid hydrolysis of chlorophyll a.--Copyright 1973, Biological Abstracts, Inc.

**STUDIES ON METABOLIC ACTIVITY OF BENTHIC BACTERIA ISOLATED FROM THREE LAKES,**
Nicolas Copernicus Univ. of Torun (Poland). Lab. of Microbiology.
E. Strzelezyk, U. Leniarska, and W. Donderski.
Acta Microbiologica Polonica, Ser. B, Vol 6, No 13, p 125-132, 1974. 4 fig, 1 tab, 15 ref.

Descriptors: *Metabolism, *Bottom organisms, *Carbohydrates, *Bacteria, Respiration, Trophic level, Food habits, Nutrient requirements, Seasonal, Oxygen requirements.
Identifiers: *Poland, *Lake Jeziorak(Poland), *Lake Tynwald(Poland), *Lake Jasne(Poland), Glucose, Fructose, Maltose, Arabinose, Xylose, Ribose, Cellobiose, Casamino acids.

Metabolic activities of 480 isolates of benthic bacteria on nine substrates (glucose, fructose, maltose, arabinose, xylose, ribose, cellobiose, soluble starch, and casamino acids) which are often in respiratory studies and which possibly occur in natural environments were studied. The bacteria were obtained from bottom sediments of Lakes Jeziorak and Tynwald (eutrophic) and Jasne (mesotrophic) in northern Poland. Glucose and fructose were the most frequently attacked carbohydrates, but some strains isolated from all lakes in winter failed to utilize these sugars. Depending on time of isolation, some strains respired actively on the substrates but others did not. The most metabolically active strains were from Lake Jasne, the least active from Lake Tynwald. Many isolates did not attack arabinose; those which respired actively. With many isolates no oxygen uptake was observed on ribose, xylose, cellobiose, and starch; those from Lakes Jasne and Jeziorak which used these carbohydrates respired more actively than Lake Tynwald isolates. Most benthic bacteria did not attack soluble starch. Respiratory values on casamino acids were generally higher than those on carbohydrates, but many strains showed no oxygen uptake. In general metabolic activity depended on time of isolation. No differences were observed between chromogenic and non-chromogenic bacteria. (Buchanan-Davidson--Wisconsin)

**BIOLOGICAL AND CHEMICAL MECHANISMS IN EUTROPHICATION OF FRESHWATER LAKES,**
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
D. W. Schindler, and D. R. S. Lean.
Annals New York Academy of Sciences, Vol 250, p 129-135, 1974. 4 fig, 21 ref.

Descriptors: *Biological properties, *Chemical properties, *Eutrophication, *Analytical techniques, Methodology, Testing procedures, Estuaries, Lakes, Measurement, Limiting factors, Phosphorus, Primary productivity, Standing crops, Mode of action, Productivity, Phosphorus compounds, Chemical analysis, Nitrogen compounds, Carbon, Crop response, Light penetration, Turbidity, Hudson River.
Identifiers: *Hudson Estuary.

No methodology has been developed to study estuarine eutrophication. Errors in accepted limnological methods and beliefs affect interpretations of results. Phosphorus is the element most responsible for eutrophication but no technique positively identified any form of phosphorus in natural waters as different methods provide differing results. High phosphorus concentrations in the lower hypolimnion of lakes may not be due to feedback from sediment but toe phosphorus-containing seston sedimentation; little phosphorus that reaches sediments is returned to the euphotic zone. Under oxic conditions phosphorus should precipitate as ferric phosphate or coprecipitate with ferric hydroxide; under anoxic conditions reduction to iron should precipitate iron sulfide and release phosphate ions, but little phosphorus release is observed. Bioassays indicate nutrients limiting productivity but do not identify nutrients which caused earlier productivity increases. Standing crop determinations are more relevant than primary production results and are determined by phosphorus and nitrogen supplies (carbon influences growth rate); standing crops are also affected by both death and birth rates. Primary production is dependent on light; but silt loads may reduce photosynthesis and prevent algal growth. Attempts to alleviate eutrophication of Hudson Estuary should not be based on single factors with simplistic solutions which could be costly or dangerous. (Buchanan-Davidson--Wisconsin)

**TRANSFER OF HEAT, FRESH WATER AND NUTRIENTS THROUGH THE SEASONAL THERMOCLINE,**
Institute of Oceanographic Sciences, Wormley (England).
R. D. Pingree, and L. Pennycuick.
Journal Marine Biological Association of the United Kingdom, Vol 55, No 2, p 261-274, 1975. 9 fig, 1 tab, 23 ref.

Descriptors: *Mixing, *Sea water, *Salinity, *Phosphates, *Seasonal, *Thermocline, Water temperature, Vertical migration, Advection, Circulation, Productivity, Heat, Fresh water, Cycling nutrients.
Identifiers: *English Channel.

Changes in water column temperature at an English Channel station between 1902-1961 were used to determine the mean monthly heating and mean rate of vertical mixing of the water column. Lower layers are heated by mixing heat downwards, not by advection. Rate of vertical mixing at different depths was derived from rate of warming beneath the thermocline. In summer transfer of fresh water through the thermocline reduced salinity in the bottom mixed water layer. Major changes in mean salinity below the thermocline were caused by vertical mixing. In winter advection of salty water was largely responsible for increase of salinity. Mixing rates were used to estimate inorganic phosphate transfer rate through the thermocline. Phosphate distribution was stationary and at a minimum in summer. Balance between regeneration and uptake was achieved and maximum production, based on phosphate utilization, occurred in the thermocline. Maximum rate of inorganic phosphate regeneration occurred in May/June, with a minimum in February. Salini-

ty variations due to advection and horizontal turbulence maintained their identities despite local evaporation, precipitation, and vertical mixing. Monthly changes in phosphate are partly due to local effects plus development and dissipation of the thermocline; large advective effects do not significantly affect monthly variations. (Buchanan-Davidson--Wisconsin)

**SEASONAL PREVALENCE OF CHONDROCOCCUS COLUMNARIS INFECTION IN BLACK BULLHEADS FROM CLEAR LAKE, IOWA,**
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
P. R. Bowser.
J Wildl Dis, Vol 9, No 2, p 115-119, 1973.

Descriptors: *Iowa, *Fish diseases, *Bullheads, Seasonal, Lakes, Infection, Fish pathology.
Identifiers: Black bullheads, *Chondrococcus-columnaris, *Clear Lake(Iowa).

The prevalence of asymptomatic columnaris infection in black bullheads (Ictalurus meals) from Clear Lake, Iowa, during 1971 was the highest during the spring when the lake was warming, very low as summer approached and nil from July 28 through the autumn. The mean condition factor of adult black bullheads decreased through June and fluctuated at a lower level through the remainder of the summer and autumn. Mean hematocrit of adult black bullheads followed the same trend as that of condition factor. A positive correlation was evident between weekly mean condition factor and hematocrit (r = 0.90; P - 0.01).--Copyright 1973, Biological Abstracts. Inc.

**MORPHOLOGY AND ULTRASTRUCTURE OF SOME CHLOROCOCCAL ALGAE FROM THE COLLECTION PF ALGAL STRAINS IN LENINGRAD UNIVERSITY. II. MONORAPHIDIUM BRAUNII (NAG, IN KUTZ.) KOMARKOVA-LEGNEROVA STRAIN (GROMOV) 1967/231,**
Leningrad State Univ. (USSR). Biological Inst.
B. V. Gromov, K. A. Mamkaeva, and V. E. Vasilieva.
Archiv fue Hydrobiologie/Supplement 46, Algological Studies 11, p 140-150, 1974. 4 plates, 2 tab, 22 ref.

Descriptors: *Plant morphology, *Chlorophyta, *Systematics, Soil algae, Life cycles, Cytological studies.
Identifiers: *Monoraphidium braunii, Chlorococcus.

Monoraphidium braunii strain Gromov 1967/231 was isolated from a cotton field near Tashkent, USSR, and possesses ultrastructural patterns usual for chlorococcal algae. Its cells are solitary, 6-40 microns long, 3-18 microns thick. Young cells are straight or slightly curved with pointed ends. During reproduction 4-16 autospores form by division of the protoplast and are liberated by transverse rupture of the mother cell. The pyrenoid is in the middle of the cell in the periphery of the chloroplast, and contains thylakoid stacks and sometimes granum-like stacks interconnected by thylakoids. Starch grains are often located near the pyrenoid but do not form a regular envelope. Several types of large vesicles are found in the cytoplasm of young cells consisting of microbodies, lamellated inclusions, and large electrontransparent homogeneous ovoid globules. Microbodies are especially numerous in cells from old cultures. Dictyosomes are well-developed. Vesicles bud off the golgi cisternae. The outer membrane of the nuclear envelope is continuous with the endoplasmic reticulum. Chlorophylls-a and -b, alpha- and beta-carotenes, canthaxanthin, cryptoxanthin, lutein, luteinmonepoxide, violaxanthin, neoxanthin NeoA, neoxanthin, and trigydroxy-alpha-carotene are present. Alpha-cryptoxanthin and trihydroxy-alpha-carotene are detected only in young cells; canthaxanthin and luteinmonoe-poxide were found only in old cells. (Buchanan-Davidson--Wisconsin)
W75-11997

**MORPHOLOGY AND ULTRASTRUCTURE OF SOME CHLOROCOCCAL ALGAE FROM THE COLLECTION OF ALGAL STRAINS IN LENINGRAD UNIVERSITY. I. PSEUDOSPONGIOCOCCUM PROTOCOCCOIDES GEN. NOV., SP. NOV.,**
Leningrad State Univ. (USSR). Biological Inst.
B. V. Gromov, and K. A. Mamkaeva.
Archiv fur Hydrobiologie/Supplement 46, Algological Studies 10, p 1-9, 1974. 1 fig, 3 plates, 9 ref.

Descriptors: *Plant morphology, *Chlorophyta, *Systematics, *Soil algae, Life cycles, Cytological studies.
Identifiers: *Pseudospongiococcum protococcoides, Chlorococcus.

A taxonomical description of the newly identified Pseudospongiococcum protococcoides and its ultrastructural morphology is given. It was isolated from the surface of a Crimean soil. It forms a compact sediment in liquid media; on agar it forms round, dark green colonies. No slime was observed. Cells were usually isolated or in small groups and are nonmotile. Young cells are spherical or ellipsoidal and mature cells are spherical with a maximum diameter of 25 microns. The cell wall is thick with no extracellular matrix, contains cellulose, and has an outer membrane-like layer and an inner electron-transparent matrix which is not homogeneous. Invaginations of cell wall material into the cell body and tubular or lamellar protrusions of the cell wall were sometimes observed. Cytoplasmic material formed tubules in the cell wall matrix. Mature cells are multinucleate, liberating 2-32 autospores through the cell wall; autospores contained one nucleus. Reproduction is only by autospores. In small young cells the chloroplasts are spongy and in large cells net-like. Mature cell chloroplasts consist of oblong partitions interconnected by short bridges with small mitochondria and vacuoles between them; the partitions included 3-10 thylakoid stacks, each of three thylakoids. **DETERGENT PHOSPHORUS AND ALGAL GROWTH,**
Wabash Coll., Crawfordsville, Ind. Dept. of Biology.
W. N. Doemel, and A. E. Brooks.
Water Research, Vol 9, No 3, p 713-719, 1975. 6 fig, 3 tab, 24 ref.

Descriptors: *Phosphorus, *Detergents, *Growth rates, *Algae, Eutrophication, Sewage treatment, Chemical precipitation, Chlorella, Chlamydomonas, Euglena, Anabaena, Indiana, Nutrient removal.

The effects of phosphorus reduction by chemical precipitation in sewage and use of non-phosphorus detergents on algal growth were determined by mixing treated sewage with lake and river waters and measuring the growth of Chlorella pyrenoidosa. The total biomass of two strains of C. pyrenoidosa, Chlamydomas reinhardtii, Euglena gracilis, Anabaena flos-aquae, and Plectonema boryanum were determined when the algae were grown in three Indiana lake waters which had been supplemented with sewage effluents. Algal growth was not significantly decreased when the total phosphorus was reduced 50% by alkaline treatment. When C. pyrenoidosa was grown in water to which sewage effluents from a motel treatment system were added, in which reactive phosphorus was reduced 57% by supplying the motel with non-phosphorus cleaning products, no reduction in algal growth was also observed. Only when sewage effluents were advance treated so that reactive phosphorus levels were below 1 2 mg (reduced 92%) was algal growth significantly decreased. The data support the contention that the only effective means of phosphorus removal is by advanced treatment in which 90-95% of the phosphorus is removed from municipal wastes and that the removal of phosphorus from detergents will be insufficient to reduce algal growth in most bodies of water. (Buchanan-Davidson--Wisconsin)

**DANGER SIGNS FOR TAHOE'S FUTURE,**
California Univ., Davis. Div of Environmental Studies.
C. R. Goldman, and T. A. Cahill.
Cry California, Spring 1975. 6 p, 4 fig, 1 tab.

Descriptors: *Water quality, *Lakes, *Eutrophication, Urbanization, Primary productivity, California, Daphnia, Algae, Fish stocking, Zooplankton, Nevada, Land use, Planning, Fish food organisms, Air pollution, Sulfur.
Identifiers: *Lake Tahoe(Calif), Carbon monoxide.

Since 1959 qualitative measurements of Lake Tahoe's water have shown increasing fertility. Algal growth rose 25% between 1968-1971; since then algal growth has increased but the annual rate of increase has dropped. Synoptic studies show that high-fertility water masses are gradually spreading over the entire lake surface. Zooplankton--Daphnia rosea, Daphnia pulex, and Bosmina longirostris--have disappeared, perhaps due to introducrion of opossum shrimp (Mysis relicta) and red salmon fry. Their disappearance may be contributed to the lake's green algal crop increase. Tahoe is still oligothrophic; if nutrient inflow can be retarded, this low fertility might be preserved. Air quality of the basin is also declining. A 19 California Air Resources Board study revealed that eye-stinging oxidants were half as dense in Tahoe as in Los Angeles, but carbon monoxide, hydrocarbon, and lead levels were higher. Atmospheric aerosols--sulfur-containing particulates, fine soil, and automobile pollutants--are the major cause of reduced visibility. Sulfur-containing particulates result from combustion of fuel by automobiles and planes, are a by-product of automobile catalytic converters, and may be carried into the area by wind. Through sound, strictly enforced land development restrictions, Tahoe's beauty can still be preserved. (Buchanan-Davidson--Wisconsin)

**AN ECOLOGICAL EVALUATION OF HEATED WATER DISCHARGE ON PHYTOPLANKTON BLOOMS IN THE POTOMAC RIVER,**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
G. M. Simmons, and B. J. Armitage.
Hydrobiologia, Vol 45, No 4, p 441-465, 1974. 7 fig, 6 tab, 21 ref.

Descriptors: *Phytoplankton, *Eutrophication, *Potomac River, *Thermal pollution, Virginia, Dominant organisms, Biological communities, Algae, Cyanophyta, Growth rates, Nuisance algae, Powerplants, Nutrients, Oxygen, Nitrogen, Nitrates, Phosphates, Water temperature, Variables.
Identifiers: Microcystis aeruginosa.

An eight month ecological study of the Virginia side of the Potomac River indicated that the thermal discharge of the Possum Point Power Station had no effect on the density or composition of algal blooms in the Potomac River. Of the 47 species of algae identified, blue-green species predominated during periods of accelerated growth. Microcystis aeruginosa was the dominant species in algal mats. Evidence of nuisance algal blooms was first observed upstream from the power plant, and mean algal densities were 40-

ıter upstream. The mean nutrient levels ɔecially nitrate nitrogen and orthophsophate) at tream control stations were slightly less due to l uptake. It was concluded that the Occoquan upper Potomac River areas are sites of major l blooms caused by nutrient loadings from upam areas; then the mats appear to drift into vnstream areas. There was no evidence that the sum Point Power Station added nutrients. The n temperature of the water in the heated water e was approximately 4.5C higher than water in t of the plant or upstream; oxygen requireits were reduced 0.9 mg/l but oxygen saturation es were elevated 20.0%. criptors: *Succession, *Phytoplankton, de of action, Biological communities, Mathecal models, Measurement, California, nass.
tifiers: *Succession rate, Castle Lake(Calif).

quantitatively analyze relationships between ession and macroscopic ecosystem processes ved responsible for succession, the parameter cession rate' is introduced to measure rate of ge of species composition in natural commu-. A time series of component species asses is the only data required to evaluate ession rate for a given community. Succession in Castle Lake, California, a dimictic otrophic lake, are given. Phytoplankton were cted about every five days at 0-30 m following g overturn, counted in a phase contrast oscope, converted to cell volume for each of 40 species, and the total volume of each spen a water column determined by trapezoidal ration. Succession rates decreased with time May to August and were consistent with station of the community composition after exl perturbation. Decreasing succession rates be attributable to decreasing fluctuations in endent factors. The succession rate can mine the relative importance of factors ing succession and help identify man-made rbances of aquatic ecosystems before connces such as accelerated eutrophication . Introduction of molybdenum into the nion caused the succession rate to reach abally high values immediately because of a oryon sertularia biomass increase. Correla- between succession rate and watershed s can pinpoint disturbances. (Buchananlson--Wisconsin)

ES OF SUPPLY OF NITROGEN AND PHORUS TO LAKE WINNIPEG, TOBA, IN RELATION TO THE DIVEROF MISSOURI RIVER WATER INTO THE ND ASSINIBOINE RIVERS,
ies Research Board of Canada, Winnipeg toba). Freshwater Inst.
Brunskill.
water Institute Reprint No 341, from son Diversion Project Presentations, 'W. G. and J. J. Keleher, editors. Manitoba Enental Council Study No 2, September 1974. fig, 3 tab, 3 ref.

ptors: *Eutrophication, *Alteration of flow, ents, Water quality, Ecology, Migration, migration, Environmental effects, Canada, ion, North Dakota, Lakes, Rivers, Missouri Phosphorus, Nitrogen, Irrigation water.
iers: *Garrison Diversion(ND), *Lake WinManitoba), Red River(Manitoba), Asne River(Manitoba).

To study rate of nutrient supply to Lake Winnipeg in relation to the Garison Diversion Project in North Dakota, water samples were analyzed. Levels of phosphorus and nitrogen in the rivers of the watershed and lake indicated mesotrophy. However over 80% of the phosphorus and 60% of the nitrogen were added to the South Basin which indicated eutrophication. Frequent blooms of Anabaena flos-aquae and Microcystis aeruginosa were observed. C14 uptake studies indicated that algal growth was probably limited by light penetration. The North Basin received less suspended sediment, was clearer, and concentrations of nitrogen, phosphorus and silica were reduced in mid-summer after blue-green algal blooms. Addition of Missouri River water to the watershed sould be less than 1% of total Red River inflow, might carry about 70 metric tons of phosphorus, 280 tons nitrogen, and 28,000 tons suspended sediment per year; and would probably have an undetectable effect on eutrophication of Lake Winnipeg. At least 12 species of fish occur in the Missouri drainage basin which are absent in the Lake Winnipeg drainage basin; of these the gizzard shad (Dorosoma cepedianum) may be detrimental. Migration of aquatic plants and animals may also be of concern. (Buchanan-Davidson--Wisconsin)

**PICK-UP AND METABOLISM OF DDT, DIELDRIN AND PHOTODIELDRIN BY A FRESH WATER ALGA (ANKISTRODESMUS AMALLOIDES) AND A MICROCRUSTACEAN (DAPHNIA PULEX),**
Illinois Univ., Chicago. Dept. of Biological Sciences.
S. Neudorf, and M. A. Q. Khan.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 4, p 443-450, 1975. 2 fig, 3 tab, 27 ref. PHS ES-00808.

Descriptors: *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Uptake(Biological), Metabolism, DDT, Dieldrin, Algae, Daphnia, Absorption, Adsorption, Metabolism, Solubility.
Identifiers: *Chemical transformation, Photodieldrin, Ankistrodesmus amalloides, Daphnia pulex, Biological magnification.

To determine the fate of insecticides in fresh water food chains, the absorption/ adsorption and metabolism of DDT, dieldrin, and photodieldrin by the fesh water alga, Ankistrodesmus amalloides, and microcrustacean, Daphnia pulex, were studied. Total pick-up of DDT by A. amalloides, during 1-3 hours was 2.5 times higher than that of dieldrin and 10 times higher than that of photodieldrin and seemed related to their water solubilities. Uptake efficiency decreased with increased cell density. For A. amalloides maximum absorption time was 120 minutes for DDT, 30-60 minutes for dieldrin, and 30 minutes for photodieldrin. The cells continued to absorb-adsorb DDT and dieldrin slowly, but photodieldrin concentration in cells did not increase up to three hours. Dieldrin was magnified 2-3 times less and photodieldrin about 6 times less than DDT by A. amalloides. This alga has a very low affinity for photodieldrin, the most polar (least lipohilic) of the insecticides. A. amalloides metabolized DDT to DDE (3.5%) ang DDD (0.8%). Daphnia pulex showed 13.6% conversion of DDT to DDE. No other DDT metabolites were detected. (Buchanan-Davidson--Wisconsin)

**1974 ANNUAL REPORT OF THE FRESHWATER BIOLOGICAL INVESTIGATION UNIT.**
Ministry of Agriculture, Antrim (Northern Ireland). Freshwater Biological Investigation Unit.
Department of Agriculture for Northern Ireland. 19 p, 5 fig, 9 tab.

Descriptors: *Water pollution sources, *Eutrophication, *Investigations, *Algae, Phosphorus, Nutrients, Fertilizers, Phosphorus compounds, Nitrates, Nitrogen, Cultures, Growth rates, Agricultural runoff, Sewage effluents, Nutrient removal, Watersheds(Basins), Forestry, Forest soils, Limiting factors, Bioassays, Cyanophyta, Diatoms, Zooplankton, Silica.
Identifiers: Nutrient sources, *Ireland, Lough Neagh(No Ireland), River Main(No Ireland), Lough Erne(No Ireland), Alkaline phosphatase activity, Otho-phosphate budget, Creatine.

The Freshwater Biological Investigation Unit of Northern Ireland was established to investigate algal blooms in Lough Neagh, and was expanded to other water bodies. Phosphorus is the critical nutrient limiting algal production in Lough Neagh. Soluble ortho-phosphate is the form most readily utilized; 24% comes from agriculture and land drainage. In the River Main catchment area, less that 10% nitrate nitrogen and other nutrients were from point sources indicating that nutrients other than phosphorus cannot be significantly reduced by removal at point sources. The effects of afforestation of nutrients in upland water bodies were studied. Reservoir phosphorus concentrations were close to values predicted from known phosphorus fertilizer applications, but high phosphorus concentrations were not necessarily associated with algal blooms; some other nutrient was limiting algal growth. Although high alkaline phosphatase activity levels indicated phosphorus-limited algal growth, the level in the River Main was higher than in Lough Neagh. Cultures of algae were prepared to study growth characteristics and nutrition. The relationship between phosphorus concentration and growth rate of Oscillatoria redekei was studied. Algae grew faster in Lough Neagh than in the laboratory due to light conditions. Chlorphyll-a distribution and the phsophorus budget for Lough Erne were determined. (Buchanan-Davidson--Wisconsin)

**EUTROPHICATION,**
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
D. W. Schindler.
In: 'The Allocative Conflicts in Water-Resource Management,' Agassiz Center for Water Studies, University of Manitoba, Winnipeg, 1974, p 255-266, 2 fig, 10 ref. (FWI Reprint No 342).

Descriptors: *Eutrophication, *Water pollution sources, Phosphorus, Nitrogen Fertilization, Agricultural runoff, Sewage effluents, Feed lots, Forest management, Environment, Pesticides, Social aspects, Governments, Water pollution control, Recycling, Sewage treatment, Sewage disposal, Water treatment, Watershed management, Canada.
Identifiers: Sewage irrigation systems, Sewage recycling.

Phosphorus and nitrogen account for most eutrophication problems. Fertilization of terrestrial ecosystems can be controlled, but no satisfactory domestic waste controls have been devised. Algal species responding to these nutrients often produce noxious tastes, odors, toxins, mats, or scums. Oxygen used in the decay processes suffocates other organisms. Sewage effluents, Feedlots, agricultural fertilizers, and poor forest management all contribute to eutrophication. Present Canadian agencies are inefficient in controlling pesticides which can act as toxins. A sewage irrigation system that can jointly act as a terrestrial nutrient source and water purification plant could recycle nutrients in an ecosystem with less danger of pollution and eutrophication than importation of fertilizers. Soil percolation and crop demand could serve as sewage treatment plants. Cost of fertilizers, eutrophication control, sewage disposal, and water purification could be substituted by cost of transporting sewage for terrestrial recycling and could be shared by urban and rural dwellers. Problems of accumulation of heavy metals, pesticides, and toxic wastes in farm produce; health and odor problems in sewage irrigated areas; leakage of nitrogen in soils; and

winter storage of effluents would have to be resolved. A long range, sound environmental policy must be instituted. (Buchanan-Davidson--Wisconsin)

**WILL BAIKAL AND TAHOE BE SAVED,**
California Univ., Davis. Div. of Environmental Studies.
C. R. Goldman.
Cry California, Winter 1973/74. 7 p.

Descriptors: *Eutrophication, *International commissions, *Foreign research, California, Commercial fish, Urbanization, Water pollution effects, Aquatic life, Aquatic populations, Lumbering, Soil erosion, Tourism, Nevada, Industrial wastes, Water pollution sources, Limnology, Hydrology, United States, Environmental effects, Air pollution, Snow removal, Sediment discharge.
Identifiers: *Lake Baikal(USSR), *Lake Tahoe(Calif.-Nev.), Scientific exchange program.

An exchange program between the United States and the Soviet Union to reduce water pollution investigates Lake Tahoe, California-Nevada and Lake Baikal, USSR. Lake Baikal, the world's oldest, largest, and deepest freshwater lake is very clear, low in minerals, and contains nearly 600 plant and 1200 animal species, three-quarters of which are endemic. Although cellulose plant effluents meet water quality standards for human consumption, they may be lethal to lake organisms. Omul are declining due to overfishing and use of spawning streams for log flotation. Logging, soil erosion, tourist activities, and industrial developments are causing eutrophication. USSR's Hydrometeorological Services conduct extensive limnological research on effects of man's activities on the lake's hydrological, chemical, and biological processes. Lake Tahoe is less complex and has a less diversified aquatic population. An environmental research program, Research Applied to National Needs, is monitoring Tahoe's physical and biological condition and surrounding terrestrial environment. University Extension and political science programs have been established to speed application of research results. Both areas have air pollution and snow removal problems; California is now studying the Soviet Union's method of snow disposal. Solutions to these problems will depend on governmental ability to use scientific evidence and act to protect mankind's natural heritage. (Buchanan-Davidson--Wisconsin)

**EXPERIMENTALLY INCREASED FISH STOCK IN THE POND TYPE LAKE WARNIAK. VI. BIOMASS AND PRODUCTION OF PHYTOPLANKTON,**
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
I. Spodniewska, and A. Hillbricht-Ilkowska.
Ekologia Polska, Vol 21, No 32, p 521-532, 1973. 1 fig, 8 tab, 22 ref.

Descriptors: *Biomass, *Productivity, *Phytoplankton, *Fish stocking, Herbivores, Carp, Diatoms, Nannoplankton, Decomposing organic matter, Dinoflagellates, Chlorophyta, Periphyton, Cyanophyta, Photosynthesis.
Identifiers: *Lake Warniak(Poland), Bream.

Changes in phytoplankton biomass and production were studied in Lake Warniak, a small pond type lake in Poland, for three years (1967-1969) after introduction of carp and bream. No large differences were observed in phytoplankton development at the various sampling sites; the observed differences between sites became smaller in consecutive years. There was a decrease in phytoplankton biomass and production; an increase in the amount of nannoplankton in biomass and production; a decrease in the efficiency of phytoplankton production; an increase in relative photosynthetic activity due to the presence of more nannoplankton in the total phytoplankton biomass; and an increase in the destruction of organic matter in consecutive years. The whole lake became more uniform as shown by smaller differences in phytoplankton biomass, production, and amount of organic matter destruction, possibly due to increased turbidity due to increased fish penetration. The relative photosynthetic activity of phytoplankton increased due to changes in species composition, but the total phytoplankton production decreased. This increased activity may have been the result of changes in the environment caused by the fish. (Buchanan-Davidson-Wisconsin).

**GROWTH OF THE GREEN ALGA CODIUM FRAGILE IN A CONNECTICUT ESTUARY,**
Yale Univ., New Haven, Conn. Dept. of Biology.
K. C. Malinowski, and J. Ramus.
J Phycol, Vol 9, No 1, p 102-110, 1973.

Descriptors: *Connecticut, Estuaries, *Chlorophyta, *Algae, *Eutrophication, Salinity, Seasonal, Temperature, Nitrogen, Reproduction, Water pollution effects.
Identifiers: *Codium-fragile, *Niantic River(Conn), Seaweed.

An in situ comparison of environmental and physiological factors was undertaken in 1971-72 (15 months) in the Niantic River estuary to elucidate some of the important aspects of the growth and development of the seaweed C. fragile. In general, Codium in the estuary has a growing season of from 6-9 mo. Growth increments during this period are relatively constant. Temperature and salinity are the main limiting factors, although low summer concentrations of inorganic N may also be involved. Repoduction by means of swarmers occurs only in late summer or autumn. Codium appears highly adapted to the role of a colonizing species. It not only possesses the capability to occupy the harshest of environments, but also a system of reproductive alternatives which facilitates rapid colonization. The availability of substrate for attachment is the chief factor limiting is spread in this estuarine system.--Copyright 1973, Biological Abstracts, Inc.

**INFLUENCE OF ENVIRONMENTAL STRESS ON ENUMERATION OF INDICATOR BACTERIA FROM NATURAL WATERS,**
Montana State Univ., Bozeman. Dept. of Microbiology.
G. K. Bissonnette, J. J. Jezeski, G. A. McFeters, and D. G. Stuart.
Applied Microbiology, Vol 29, No 2, p 186-194, 1975. 2 fig, 4 tab, 25 ref. OWRR B-035 MONT(3) and B-040 MONT(2).

Descriptors: *Water injury, *Coliforms, *Stress, *Enteric bacteria, *Bacteria, E. coli, Streptococcus, Cultures, Plant physiology, *Bioindicators, Pollutant identification.
Identifiers: *Environmental stress, Injury.

With the aid of membrane filter chambers, it was possible to follow the survival, injury, and recovery characteristics of populations of indicator organisms (Escherichia coli and Streptococcus faecalis) as a function of exposure time in various aquatic environments. It was observed that upon exposure to the aquatic environment a significant proportion of cells lost their ability to produce colonies on a selective medium yet retained this capability on a nutritionally rich, nonselective medium. Discrepancies in colony-forming units between nonselective and selective media indicated that a substantial portion of bacterial cells may become physiologically injured due to the environmental stress imposed by the aquatic environment. The extent of injury was observed to vary considerably among eight different stream environments. It was observed that the injury induced to a population of E. coli during exposure to the aquatic environment could be rapidly repaired in a nutritionally rich, nonselective medium. A the injured cell population was exposed to th rich nonselective broth, increasing proportions cells were able to repair themselves so that the became insensitive to inhibitory agents in a selective media (Jones-Wisconsin).

**EFFECT OF BROMEX-50 ON PLANKT POPULATION IN FISH PONDS,**
Agricultural Research Organization, Dor (Isra Fish and Aquaculture Station.
G. L. Schroeder.
Bamidgeh, Vol 27, No 1, p 3-7, March 1975. 2 f tab, 4 ref.

Descriptors: *Plankton, *Primary produc *Zooplankton, Ponds, *Toxins, *Biom Phytoplankton, Mortality, Parasitism, parasites.
Identifiers: *Lernaea, Bromex-50.

Four fish ponds were treated with Bromex-5 the eradication of the parasite Lernaea. Plan concentrations, dissolved oxygen, and pH monitored prior to and following the Brome treatment. In moderately and heavily sto ponds zooplankton decreased from 0.8 mg weight per liter to 0.05 mg/l and 0.1 mg/l to mg/l respectively. Analysis of the pond wat hours after the Bromex treatment revealed zooplankton activity. At plus 2 days zooplan activity had returned and at plus 7 to 9 zooplankton concentrations were similar to Bromex values. No changes related to Br were observed in phytoplankton standing st pH or DO. A microbiological study of an historically active dredge spoil disposal area in Long Island Sound showed no obvious long-term effects on the bacterial populations of water and sediment. Observations were made 4 years after the last deposition of dredge spoils. Determinations included total and faecal coliforms and numbers, hydrolytic types, and taxonomic groupings of 'total' heterotrophic bacteria. Comparisons with water and sediment from other areas of the sound indicated that the dump site was not bacteriologically unique. (Katz)

**FILTRATION OF NEUTRAL RED BY FRESH WATER CLAMS IN AEROBIC AND HYPOXIC CONDITIONS,**
Kalamazoo Coll., Mich, Dept. of Biology.
D. G. Badman.
Comparative Biochemical Physiology, Vol 51A, August 1975. 741-744, 1 fig, 1 tab, 10 ref.

Descriptors: *Molluscs, *Clams, *Animal physiology, *Biochemistry, *Filtration, *Oxygen requirements, Analytical techniques, Laboratory tests, Aerobic conditions.
Identifiers: *Fresh water clams, Neutral red, *Hypoxic condition, *Anaerobiosis, Valve activity (Clams), Elliptio dilatatus, Pleurobema coccineum, Actinonaias carinata.

Rates of filtration of neutral red by aerobic and hypoxic fresh water clams were measured to determine the role of previously observed hypoxic intense valve activity. Aerobic clams filtered readily, showing a mean initial rate of 0.051 plus or minus 0.008 mg/min (Actinonaias carinata), 0.025 plus or minus 0.006 mg/min (Elliptio dilatatus) and 0.019 plus or minus 0.006 mg/min (Pleurobema coccineum). The hypoxic rate was reduced to 0.011 plus or minus 0.006 mg/min (E. dilatatus) and 0.016 plus or minus 0.006 mg/min (P. coccineum), even though measurements were taken only when individuals had active valves and open siphons. It is concluded that the hypoxic intense valve activity does not have the replenishment of tissue oxygen as a major function. (Katz)

**NITROGEN, PHOSPHORUS, AND EUTROPHICATION IN THE COASTAL MARINE ENVIRONMENT,**
Woods Hole Oceanographic Institution, Mass.
J. H. Ryther, and W. M. Dunstan.
Science, Vol 171, p 1008-1013, March 1971. 6 p, 7 fig, 31 ref.

Descriptors: *Bioassay, *Algae, *Nitrogen, *Phosphates, *Eutrophication, Water pollution effects, Coastal marshes, Coasts, Detergents, Ammonia, Nitrogen compounds, Phosphorus, Aquatic life, Algal control, Aquatic weed control, Control, Chemical analysis, Pollutant identification, Water analysis, Water pollution, Water pollution sources.
Identifiers: *Coastal marine environment, Coastal waters, Effluent limitations.

The importance of nitrogen in coastal marine waters is discussed. Nitrogen is described as the critical limiting factor to algal growth and eutrophication. Bioassay experiments and the distribution of phosphorus and inorganic nitrogen compel this conclusion. Experiments show that approximately twice the amount of phosphate usable by algae is present. Factors contributing to the surplus include: the low nitrogen to phosphorous ratio in terrigenous contributions containing human waste; and the quicker regeneration of phosphorus, from decomposing organic matter, in contrast to ammonia. In conclusion, the report comments that eutrophication in coastal marine waters is not likely to be retarded by removing phosphates from detergents; and further, replacing phosphorus with nitrogen-containing nitrilotriacetic acid may be even more harmful. (Hoffman-Florida)

**ARE CHEMICALS USED ALGAE CONTROL BIODEGRADABLE.**
Wisconsin Univ., Madison.
G. P. Fitzgerald.
Water and Sewage Works, Vol 122, No 5, p 82-85, May, 1975. 5 tab, 7 ref.

Descriptors: *Algicides, *Toxicity, *Biodegradation, Chemicals, Copper, Silver, Analytical techniques, Environmental effects, Aquatic organisms, Water pollution effects, *Algal control.
Identifiers: Methyl mercuric choloride.

Concern about the use of toxic chemicals to control the growth of nuisance algae has led to a study on the biodegradability of these substances. The simple procedure used for testing various commercial algicides was to apply the initial dosage required to stop the growth of the algae present, reinnoculate with algae, and then observe whether additional algicide was needed to stop the growth of reintroduced algae. If no additional dose was required, this was taken as an indication that the chemical was not biodegraded by the algae. If additional chemical was needed, it was assumed that the initial dose had been biodegraded. Of the products containing copper, silver, mercuric chloride, phenyl mercuric acetate, and quaternary ammonium compounds tested over the last 11 years, all were found to be biodegraded by the treated algae. However, methyl mercuric chloride is not detoxified by the action of treated algae and its use as an algicide would be a threat to the aquatic environment. It is recommended that because methyl mercuric chloride has been determined to be non-biodegradable, all chemicals to be added to aquatic environments should be evaluated. (Orr-FIRL)

**WATER QUALITY AND SALT WATER INTRUSION IN THE LOWER NECHES RIVER,**
Lamar Univ. Beaumont, Tex. Dept. of Biology.
R. C. Harrel.
The Texas Journal of Science, Vol 26, No 1 and 2, p 107-117, February, 1975. 7 fig, 2 tab, 6 ref.

Descriptors: *Water pollution effects, *Saline water intrusion, Saline water barriers, Oil, Municipal wastes, Irrigation, Water quality, Indicators, Benthic fauna, Texas.
Identifiers: *Neches River(Texas).

The water of the lower Neches River is used to supply: a large industrial complex consisting of petrochemical refining and manufacturing, and production of lumber products; municipal water for over 350,000 people; and irrigation for 60,000 acres of rice land. The effects of salt water intrusion, carrying with it toxic and organic waste effluents from the industrialized lower reaches, are discussed. The toxic effects are augmented by the erection of salt water dams(to protect the potable water intake points) which cause a concentration of the salt water and effluents. The effects of salt water intrusion on water quality were determined from physico-chemical data and benthic macroinvertebrate studies: dissolved oxygen and pH decreased below the salt water barrier; alkalinity,

turbidity, and specific conductance increased below the barrier; the bottom substrate above the barrier was clean fine and coarse sand; below the barrier, the bottom sand was covered with several centimeters of black silt smelling of hydrogen sulfide and oil; density per individual of benthic macroinvertebrates indicated a less stable community structure below the barrier and is indicative of polluted waters; and the particular species collected below the barrier have been previously reported as living in polluted waters while those above the barrier were typically clean water species. ## 5D. Waste Treatment Processes

**INDIVIDUAL HOME WASTEWATER CHARACTERIZATION AND TREATMENT,**
Colorado Univ., Boulder. Dept. of Civil and Environmental Engineering.
E. R. Bennett, and K. D. Linstedt.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 259, $5.75 in paper copy, $2.25 in microfiche. Colorado Environmental Resources Center, Fort Collins, Completion Report Series No. 66, July 1975. 137 p, 27 fig, 38 tab, 52 ref. OWRT A-021-COLO (5). 14-31-0001-5006.

Descriptors: *Waste Water treatment, *Waste identification, *Colorado, *Domestic wastes, Septic tanks, Aerobic treatment, *Water reuse, Water pollution, *Path of pollutants, Water utilization.
Identifiers: Gray water treatment, Aerobic home sewage treatment units, Evaporation-Transpiration beds, Water reuse(domestic).

Disposal of wastewater from isolated homes in mountainous and rural locations in Colorado presents unique and difficult problems. The purpose of the study was to evaluate the flow and pollution patterns from individual homes and to evaluate existing and potential treatment methods. Field evaluation of home wastewater flow and pollutional characteristics was accomplished. The average per capita water use in the home was 44.4 gallons per day; the waste strength was 0.11 lb day of BOD per person. Data for individual fixtures and appliances were obtained with measurement of many pollutional parameters. A brief evaluation of the home treatment methods was accomplished. Laboratory bench scale studies were made to evaluate methods for treatment of the soap related wastes in the home for reuse as toilet flushing water.
W75-11852

**SPRAY IRRIGATION OF TREATED MUNICIPAL SEWAGE,**
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
W. K. Oldham.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 227-239, 1975. 2 fig, 5 tab, 3 ref.

Descriptors: *Waste water treatment, *Irrigation, *Waste water disposal, *Water reuse, Groundwater, Nutrients, Phosphorus, Nitrogen, Agriculture, Crop response, Alfalfa, *Canada.
Identifiers: *Spray irrigation.

Research was conducted to determine a water and nutrient budget for spray irrigation of secondary effluent from a municipal waste water treatment plant in the Okanagan Valley of British Columbia, Canada. The usefulness and acceptability of the forage crop produced was also considered. The long-term usefulness of such a disposal method at various rates of application was estimated. The application rate (0.32 inches/day) used in irrigating the alfalfa was close to the optimum rate for water and macro-nutrient utilization. Limiting the irrigation period to the alfalfa growing season will produce an ideal phosphorus balance. At the application rate used over the irrigation season, the average annual phosphorus increase in the five-foot deep soil horizon was 0.7 ppm. Other impurities were well absorbed by the soil and their rates of concentration increase were much lower than that for phosphorus. The alfalfa crops grown compared well with similar crops grown using non-waste water irrigation. The amount of impurities released to the groundwater was negligible. (Orr-FIRL)
W75-11856

**PACKAGE TREATMENT PLANTS AND FACTORS AFFECTING SERVICE,**
Northern Purification Services Ltd., North Vancouver (British Columbia).
P. H. Martin.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 219-225, 1975.

Descriptors: *Waste water treatment, *Sewage treatment, *Domestic wastes, Treatment facilities, *Biological treatment, Design criteria, Corrosion control, *Canada.
Identifiers: *Package plants.

Package plants of less than 20,000 gpd that use biological treatment methods are discussed. Package plants are usually chosen because of economics unsuitability of the conventional septic system, or the unavailability of a conventional municipal sewage collection service. Improvements in package plants over the last ten years are described. The use of non-corrosive long lived materials result in reduced preventative maintenance of the shell, extended life and a guaranteed reuse factor for the product. Concrete technology has produced concrete finishes that are essentially inert if properly applied. Plastic piping, valving and fastenings have aided in minimizing corrosion and easing the disassembly and reassembly of components. Control and fail safe systems are now available. Processes to minimize the adverse effects of fluctuating organic and hydraulic loads have been refined. Plant design has become more aesthetically pleasing. Package plants have clearly defined performance limits and cannot be expected to perform outside these limits. The performance of a package plant will be dependent on the quality of the engineering design. Regular trained service or preventative maintenance procedures are a necessity. ()(Orr-FIRL)
W75-11857

**ALTERNATIVE METHODS OF DISINFECTION,**
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
K. J. Roberts.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 183-193, 1975. 2 fig, 1 tab, 18 ref.

Descriptors: *Disinfection, *Waste water treatment, *Chlorination, *Ozone, Gamma rays, Ultraviolet radiation, Oxidation, Pilot plants.
Identifiers: Chemical oxidation, Chlorine dioxide.

Alternatives to chlorine disinfection of waste water, such as dechlorination, chemical oxidation, ultraviolet and gamma ionizing radiation, are examined. Dechlorination is the removal of all or part of the total chlorine residual through the addi tion of sulfur dioxide or other sulfur bearing com pounds. Chemical oxidation can be accomplishe by the application of ozone or chlorine dioxide Ozone is a powerful oxidizing agent, an efficien disinfectant, and leaves a beneficial dissolved ox ygen residual. The bactericidal efficiency o chlorine dioxide is comparable to that of chlorin in the neutral pH range and increases significantl with pH. Ultraviolet radiation does not appear t be a feasible method for disinfection of wast water because the water to be treated by UV mu be free of suspended particles that would act as shield to keep the electromagnetic waves from a tually striking and killing the organisms. A pil plant study for the disinfection of activated sludg effluent by gamma irradiation is presented detail. Results show: coliform organisms are th most sensitive to irradiation treatment; good disi fection can be achieved with the application of dose of 100,000 rads; the disinfecting process is r liable because the applied radiation is constant an predictable; and, the effluent from the irradiatio reactor was nontoxic to fish. Each method treatment has its own advantages and disa vantages. (Orr-FIRL)

**NITROGEN REMOVAL FROM MUNICIPA WASTEWATER,**
Du Pont of Canada Ltd., Montreal (Quebec).
D. C. Climenhage.
Environment Canada Research Report No. (1974). 33 p, 6 fig, 5 tab, 29 ref.

Descriptors: *Waste water treatment, *Biologic treatment, *Denitrification, Nitrification, Sewa treatment, Nitrogen cycle, Pilot plants, Biochem cal oxygen demand.
Identifiers: *Nitrogen removal.

A biological treatment process has been develop to remove nitrogen from industrial waste wat The denitrification stage is first, followed by extended aeration stage that effects BOD redu tion and nitrification. Mixed liquor from aerated stage is recycled at a high rate to anaerobic stage where nitrate is denitrified usi the sewage as the organic carbon source. The a vantage of this process is that the need for carb addition to the denitrification stage is eliminat A pilot plant study was performed to test the fectiveness of this process on municipal wa water. The domestic waste water that was to used as the test substrate had a very low BOD a was therefore mixed with hexamethylene diam and methanol to raise the BOD and orga nitrogen concentration. An overall nitrog removal efficiency of 85-90% was achieved o mixture of 25% sewage and 75% chemical ad tives. The efficiences were based on total nitrog in the influent and filtered effluent and w achieved with recycle to feed ratios of 1:1 to 1. About 18% of the nitrogen removal was accoun for by recycle to the anaerobic first stage about 13% was accounted for by cell synthe Further experimentation is recommended to c firm the results of this test using full stren sewage without chemical additives, and to vestigate the mechanism of nitrogen removal the effect of important parameters on nitro removal efficiency. to meet more stringent pollution control ents, municipalities have found it neces-orrect problems created by existing com-wer systems which suffer from waste erflows. Preceding correction, analysis of l sewer overflow systems must be per-nd the usual method is based on flow g programs at specific overflow points. hod provides accurate results only if the stallation is functioning properly. Thus a rational method of analysis has been developed which determines the number, duration, and volume of overflows occurring in a system with various intercepting capacities as well as the capacities of storm storage tanks and overflow treatment facilities required to provide various degrees of overflow reduction. This concept may be adapted to any region provided that rainfall data are available and the percentage of runoff can be determined. (Sandoski-FIRL)

**EUROPEAN DEWATERING SYSTEM AIDS QUEBEC PROJECT,**
R. L. Consedine.
Engineering and Contract Record, Vol. 86, No. 5, p 80, May, 1973. 2 fig.

Descriptors: *Sewerage, *Groundwater, *Installation, Pumps, Hydrants, Wellpoints, Excavation, *Dewatering, *Canada.
Identifiers: Quebec City(Canada), Groundwater control, Couplings, Pipelaying.

A fast, effective dewatering system is overcoming severe water problems and speeding excavation and pipelaying operations at a major housing project near Quebec City, Canada. The Keller method of groundwater control is used to install sanitary sewers and watermains for Development Iberville at Ville de Belair. To predrain, a series of 2-inch diameter wellpoints have been sunk. The wellpoints are self-jetting with pressure supplied using either a water hydrant or a special portable jetting pump. Once in position at the desired depth, the wellpoints are connected to a 6-inch diameter header pipeline by flexible hoses. This header line runs on the surface to a high-capacity suction and dewatering pump. The main advantage for the method lies with its speed since up to 60 wellpoints can be installed per 10-hour shift. A key reason for the quick installation is the use of Kardan couplings which permit connections to be made without tools in about 10 seconds or less. (Sandoski-FIRL)

**TOUGH DIGGING, TIGHT QUARTERS HAMPER HULL COLLECTOR SEWER JOB,**
R. L. Consedine.
Engineering and Contract Record, Vol. 86, No. 4, p 42-43, April, 1973. 3 fig.

Descriptors: *Sewers, *Storm drains, Excavation, Trenches, Construction equipment, Construction materials, *Waste water treatment, Canada.
Identifiers: Hull, Quebec, Canada.

An $889,078 contract awarded to Fedex Ltd., in October 1972 consists of placing 1600 feet of 10-foot diameter concrete horseshoe storm collector and 36-inch diameter sanitary sewer pipe in open cut to depths of 30-feet between the Maisonneuve and St. Etienne Street intersection in Hull, Quebec. Crews have been hampered by a serious lack of working area. Thus the patented Contact Sheeting system to shore up both sides of the 24-foot-wide trench was employed. This system involves driving a row of wide flange steel soldier beams along both sides of the proposed excavation, and as the excavation advances, short lengths of heavy timber sheeting are cut and fitted in front of the vertical beams. Equipment to handle the earth and rock moving operations, consist of three backhoes - plus a dozer, front-end crawler loader, a rubbertired loader, and four tandem dump trucks. The method employed is to operate a 1.25-yard backhoe on the floor of the trench and have the unit deposit excavated material off to one side of the machine. From the side of the trench wall and the hydraulic backhoe, the loader moves the material to another backhoe located at the top of the advancing trench. The 2-yard machine in turn reloads the material and dumps it into the tandem trucks. (Sandoski-FIRL)

**SANITARY SEWER SUSPENDED WITHIN STORM SEWER,**
Civil Engineering - ASCE, Vol. 43, No. 5, p 93, May, 1973. 2 fig.

Descriptors: *Sewers, *Storm drains, Pipes, Corrosion control, Conduits, Steel pipes, Concrete pipes, Joints(connections), Waste water treatment, Michigan.
Identifiers: Pontiac(Mich), Exfiltration.

A 30-inch corrugated steel sanitary sewer has been suspended from the ceiling of a 9-foot concrete storm sewer, 6400 feet long, in Pontiac, Michigan. With the strom drain serving as the conduit for the sanitary sewer line, substantial cost savings were realized over two separate lines. Both sanitary and storm sewers are new in the project known as the Joslyn Drain. The corrugated steel pipe, with asbestos fibers embedded in its zinc coating, was specified for its high degree of corrosion resistance. Tight joints, givng the necessary water-tightness, were specified to eliminate exfiltration. In addition to being reasonably light in weight, the steel pipe offers the necessary high beam strength. Inside the pipe, the corrugations are filled to improve flow. U-shaped steel bands support the sanitary sewer pipe with each leg anchored by bolts to the roof of the storm drain. Grouting in the minimal space between the two conduits at each support band ties the sewer structure together and helps it resist end forces. (Sandoski-FIRL)

**STEEL, CONCRETE FORM SEWER SUPPORT SYSTEM.**
Excavating Contractor, Vol. 67, No. 4, p 31, April, 1973. 3 fig.

Descriptors: *Combined sewers, *Storm drains, *Pipes, *Sewerage, Installation, Soil properties, Steel pipes, New York.
Identifiers: Bronx(NY).

The installation of sanitary sewer lines and storm drainage was an early priority forCo-op City in Bronx, New York since new owners were moving into their apartments as soon as each building unit was completed. Over 60,000 feet of sanitary lines, force sewer mains, and storm drains were laid in the troublesome loose soil environment. For the force main portion of the sewer network, 20-inch diameter, 3/8-inch wall spiral-welded steel pipe and fittings were used. The pipe and fittings were made to order. The pipe was treated to a cold coat of coal tar primer and a hot coat of coal tar enamel. Then it was wrapped in fiberglass and given another hot coat of coal tar enamel. A final wrap was made of kraft paper. The pipe has a cement lining approximately 3/8-inch thick. All fabricated elbows and offsets were custom designed to meet site requirements. The fabricated fittings were tested at a minimum of 125 psi. (Sandoski-FIRL)

**SUPERPOSITION OF TWO PIPES IN A COMMON, MIXED SEWER SYSTEM (RECOURS A LA SUPERPOSITION DE DEUX CONDUITES DANS UN RESEAU D'ASSAINISSEMENT UNITAIRE).**
A. Burry.
L'Eau, Vol. 68, No. 4, p 173-174, April, 1973. 3 fig.

Descriptors: *Sewerage, *Combined sewers, *Separated sewers, Dairy industry, Hospitals, Concrete pipes, Corrosion, Storm runoff, Pipes, Effluents, Treatment facilities, Waste water treatment.
Identifiers: Stoneware pipes.

Superposition of two pipes in a common, mixed sewer system in Mulhouse, France is described. The risk of premature corrosion of concrete pipes due to effluents from recently connected hospital and dairy sources prompted their separation from storm runoff in the pipes. The effluents, diluted at a ratio of 1:3, are carried by old, stoneware pipes located at the bottom of the sewer, while runoff has been switched to new concrete pipes of ovoid shape placed above the former. The upper duct discharges to the collector at a given delay caused by a retention basin while the lower duct has direct passage to the old collector. Effluent separation makes it possible to convey all or part of the effluent to a waste water treatment facility. (Takacs-FIRL)

**YAPHANK COUNTY CENTER WASTEWATER TREATMENT PLANT.**
Suffolk County Dept. of Buildings and Grounds, New York.
Consulting Engineer, Vol. 40, No. 6, p 108, June, 1973.

Descriptors: *Waste water treatment, *Treatment facilities, Effluents, Aquifers, Recycling, Nitrogen, Flow, Groundwater, Tertiary treatment, *New York.
Identifiers: Yaphank(NY).

The Department of Buildings and Grounds of Suffolk County, N. Y., retained Holzmacher, McLendon and Murrell, P.C., as environmental project consultants for an advanced waste water collection and treatment center to serve a rapidly expanding county governmental center at Yaphank, Suffolk County, New York. Flow characteristics, coupled with severe effluent limitations set up by Suffolk County for discharge to groundwater aquifers, dictated a system utilizing the most recent state-of-the-art processes. For this project waste water renovation for recycle to groundwater with the following characteristics was required: maximum effluent total nitrogen concentration of 10 mg/liter, means of equalizing the flow of influent raw waste, means to handle a 12-hour flow pattern, expansion from 250,000 gpd to an ultimate flow of 1.6 million gpd, and a total nitrogen concentration of 74 mg/liter. The process as designed meets all of the stipulated requirements with regard to effluent quality. Plant operation is simple with no stringent biological controls nor sludge recycle or mixed liquor concentration control required. Maintenance of dissolved oxygen levels is noncritical and control is not required. (Sandoski-FIRL)

**FLEXIBLE JOINT FOR SEWER PIPE,**
B. B. Garrett.
United States Patent 3,741,570. Issued June 26, 1973. Official Gazette of the United States Patent Office, Vol 911, No 4, p 1346, June 26, 1973.

Descriptors: *Sewers, *Pipes, *Joints(Connections), *Patents, Clay pipes, Waste water treatment.
Identifiers: Flexible joints, Gaskets.

A flexible joint for sewer pipes, particularly clay pipes, is described for connecting a bell pipe section and a spigot pipe section. The bell section has an internal circumferential rib forming a support for the spigot end upon which it may fulcrum during relative tilting movements of the sections. The inner surface of the bell is relieved on one side of the supporting rib, and on the other side is formed with a groove for a sealing gasket of resilient deformable material, such as rubber, the groove having a peripheral space or cavity into which the gasket material can flow or expand under operating applied compression forces. United States Patent 3,737, 038. Issued June 5, 1973. Official Gazette of the United States Patent Office, Vol 911, No 1, p 124, June 5, 1973.

Descriptors: *Combined sewers, *Screens, Flow rates, Effluents, Cleaning, *Patents, Overflow, Separation techniques, *Waste water treatment.
Identifiers: Influent, Flow pattern

Equipment and methods for screening and concentrating waste water overflow from combined sewer systems are described. Exemplary equipment includes a separator employing a substantially cylindrical rotating screen. Influent is piped upwardly into the equipment and deflected outwardly toward the inner surface of the screen in a manner to achieve a desired flow rate and flow pattern of the influent into the screen. Means are provided for controlling the flow rate and for suitably directing the influent in a plurality of substantially discrete inclined streams toward the inner surface of the rotating screen. The screen is rotated at a speed to achieve a desired centrifugal force. Effluent passes through the screen to an outlet and the remaining concentrate passes to an outlet. The screen is in the form of a screen cage having a plurality of removable screen panels for facilitating replacement of damaged screens or changing of screen type or mesh size. Cleaning means is provided for directing a cleaning flow periodically at the screen. The methods disclosed involve the manner in which the influent, effluent, concentrate and backsplash are handled, and the manner in which the influent is screened to achieve a fluid concentrate which is pumpable to other treatment equipment for ultimate disposal. Additionally, a sequence of influent feed and screen cleaning is described. (Sandoski-FIRL)

Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 99, No EE3, p 177-185, June, 1973. 6 fig, 5 ref.

Descriptors: *Storm runoff, *Model studies, Siphons, Overflow, Suspended solids, Water pollution control, Waste water treatment.

Models of four typical jet siphon type stilling pots for storm overflows, the bypass being through an unregulated siphon, were tested. The main objective was to reduce the saturation of the stilling pot with light solids. To obtain a comparison of the performance of different models, several hundred polymer beads of various densities were introduced into the upstream system of the overflow. The efficiency of the storm overflow, defined as the fraction of the solids not discharged through the bypass siphon, was then estimated. The influence of the location of the bypass siphon on the efficiency of the system investigated. (Sandoski-FIRL)

**FAIRFAX GOES FOR AWT.**
Fairfax County Wastewater System, Va.
Water and Wastes Engineering, Vol 10, No 3, p 38-39, March, 1973. 1 fig.

Descriptors: *Treatment facilities, *Sewers, *Waste water treatment, Filtration, Chlorination, Filters, Biochemical oxygen demand, Nutrient removal, Potomac River, Virginia, *Tertiary treatment.
Identifiers: Fairfax County(Va).

The Fairfax County, Virginia, Wastewater System consists of over 1400 miles of sanitary sewer lines, 32 pumping stations, and nine treatment plants. The total waste water flow in the county is approximately 50 mgd, of which 33 to 35 mgd is treated by county plants. In July 1970, Fairfax County embarked on a major sewer improvement program with the objective of reducing the total pounds of BOD5 discharged to the Potomac river. As a result of investigations, three treatment plants will be taken out of operation and major emphasis placed on expansion and additions of advanced treatment processes at the Lower Potomac Plant, one of four major facilities. Advanced Wastewater Treatment (AWT) facilities to be installed during 1973-1974 at the Lower Potomac Water Pollution Control Plant will have an average daily capacity of 36 mgd and a peak flow rate of 68 mgd. Based on raw sewage concentrations of BOD5, phosphorus, and nitrogen of 225 mg/liter, 15 mg/liter, and 50 mg/liter respectively, the AWT facilities are designed for overall treatment plant removal efficiencies as follows: BOD5 - 98.3%, phosphorus - 98.7%, and nitrogen - 98%. The AWT process consists of the following: chemical treatment with calcium of secondary effluent in solids contact treatment tanks; recarbonation in two stages with intermediate settling; filtration on granular multi-media filters to assure removal of unsettled phosphorus precipitates; and, breakpoint chlorination. **FILTER PRESS, PARTICULARLY FOR DEWATERING SLUDGE IN SEWAGE TREATMENT PLANTS,**
A. Bahr.
US Patent No 3,896,030, 4 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 936, No 4, p 1386, July 22, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water pollution control, *Filtration, *Sewage sludge treatment, Filters, Dewatering, Equipment.
Identifiers: *Filter presses.

A filter press for dewatering sludge in sewage treatment plants is described. It is comprised of two endless filter belts that retain the sludge between them. The two filter belts circulate simultaneously and are guided in concentric paths around a rotary drum against which they are held by adjustable pressure rollers so that the liquid is squeezed out of the sludge. The dewatering takes place in a sequence of five stages, the material being worked in each stage in a manner suited to its condition on leaving the previous stage. In the first stage the material, spread out over the surface of the first filter belt, is allowed to drain under gravity without the application of pressure. This is followed by a vibration stage, after which the material enters the wedge-shaped feed inlet and then passes along the horizontal pressure section. Finally the material is kneaded and pressed, between the filter belts, on its way around the asynchronous rotary roller cage. The raw material is assumed to be a watery sludge capable of flowing very easily. On its way through the press the material gradually loses water and becomes stiffer. Finally it is pressed to form a hard filter cake and kneaded to remove residual water. The more intense the kneading action the less water remains in the final hard filter cake. (Sinha-OEIS)

**RECOVERING PROTEINS FROM WASTE WATER,**
Secretary of Agriculture, Washington, D.C. (assignee).
J. W. Finley.
US Patent No 3,898,160, 5 p, 7 ref; Official Gazette of the United States Patent Office, Vol 937, No 1, p 202, August 5, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Water pollution control, Water quality control, Water purification, Separation techniques, Ion exchange, Proteins, Industrial wastes, Effluents.

A method is described for removing proteins, starch, and other materials from proteinaceous waste water thereby producing both an effluent capable of disposal into municipal waste treatment systems or waterways and a solid ferric-protein-phosphate complex. The complex is susceptible to facile recovery of the valuable proteins contained in it. The process is comprised of: adding to the proteinaceous waste water an alkali metal salt of a molecularly-dehydrated phosphate until the concentration is 0.0001 M to 0.1 M and a source of ferric ions until the concentration is 0.001 M to 0.1 M; precipitating a ferric-protein-phosphate complex and avoiding precipitation of a protein-phosphate

complex by raising the pH of the so-treated waste to 7.0; and separating the effluent from the ferric-protein-phosphate complex precipitate. (Sinha-OEIS)

**PROCESS AND APPARATUS FOR RECOVERING CLEAN WATER AND SOLIDS FROM DILUTE, AQUEOUS, SOLIDS CONTAINING SOLUTIONS OR DISPERSIONS,**
Hanover Research Corp., East Hanover, N.J. (assignee).
C. Greenfield, R. E. Casparian, and A. J. Bonanno.
US Patent, No 3,898,134, 9 p, 2 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 937, No 1, p 194-195, August 5, 1975.

Descriptors: *Waste water treatment, *Patents, *Water pollution control, *Water purification, Water quality control, *Evaporation, *Condensation, Dehydration, Separation techniques, Heat transfer, Solid wastes, Equipment.

A process and apparatus are described for recovering clean water and essentially dry solids from dilute aqueous solids. A dilute stream of aqueous solids is concentrated by heat evaporation and the evaporated water is condensed and recovered. The concentrated aqueous solids are mixed with relatively non-volatile fluidizing oil and subjected to dehydration by heat evaporation. The steam formed in the dehydration step is used to supply heat for the concentration step. The solids are separated from the fluidizing oil and recovered in an essentially dry state while the fluidizing oil is recycled. If desired, a light, relatively volatile oil may be mixed with the dilute aqueous solids to prevent scaling and fouling in the concentration evaporator. (Sinha-OEIS)

**SINGLE BASIN AERATED SEWAGE LAGOON WITH SPRING TIME INTENSIFIED AERATION,**
Atara Corp., Montreal (Canada). (assignee).
D. S. Murphy.
US Patent No 3,897,334, 4 p, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 935, No 5, p 1834-1835, July 29, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Aeration, Water pollution treatment, Aerated lagoons, Seasonal, Temperature control.

An aerated sewage lagoon has aerators placed densely near the inflow, then gradually less densely proceeding towards the outflow and then densely placed again and finally an area of no aeration. The aerators can be shut off so that in spring there is a second high intensity area to cope with the suddenly increased demand due to winter dormancy. In summer the high intensity aeration is followed by an area over which the aeration continues but at gradually reduced intensity as the sewage moves downstream to the outflow. In winter aerators nearer the outflow can be shut off entirely. (Sinha-OEIS)
W75-12060

**METHOD OF TREATING SEWAGE TO ENHANCE AEROBIC DECOMPOSITION,**
K. A. Digney, and A. P. Gallauresi.
US Patent No 3,896,027, 4 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 936, No 4, p 1385, July 22, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Aerobic treatment, *Aeration, Water pollution treatment, Dissolved oxygen, Aerobic bacteria, Domestic wastes.
Identifiers: *Aerobic decomposition.

The method described increases the level of air or other gas entrained or dissolved in a liquid. The principal application is to enhance aerobic decomposition in sewage by recirculation through a pump where a high level of dissolved oxygen is maintained by mixing atmospheric air into the sewage as it passes through the pump. A hollow shaft, which may conveniently comprise the pump impeller drive shaft, extends from an air intake opening above the sewage level to communicate with the hollow interior of the impeller blades. The air is discharged through openings preferably at or near the tips of the blades, thereby entering the stream of sewage passing through the pump at the point of highest velocity. Oxygen in the air is ultimately mixed and retained in the sewage to stimulate bacterial activity. (Sinha-OEIS)
W75-12061

**AEROBIC SEWAGE TREATMENT SYSTEM,**
Coate Burial Vault, Inc., West Milton, Ohio. (assignee).
K. J. Yost.
US Patent No 3,879,285, 7 p, 12 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 933, No 4, p 1741, April 22, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, *Aeration, *Aerobic treatment, Domestic wastes, Septic tanks, Anaerobic bacteria, Biodegradation.

Sewage water is directed into an enclosed generally circular shallow tank to expose a large surface area of the sewage water per unit volume. Air is circulated over the surface of the sewage water in a generally circular direction to effect horizontal circulation of the sewage water within the tank and diffusion of the air into the liquid. The water treated in the first aerobic tank is directed from a center outlet in the first tank into a similarly constructed second tank which also provides for horizontal circulation of the treated water and diffusion of the air in response to a generally circular flow of air. The air flow within each tank is produced by connecting the air outlet of the tank to a chimney which projects upward adjacent the outer wall of the residence and creates a natural draft. In another embodiment, the horizontal air flow is produced by a number of circumferentially spaced air conduits which slope downward towards the surface of the sewage water and are connected to an air supply pump. (Sinha-OEIS)
W75-12063

**REMODELLING AT NORWICH,**
A. McVie.
The Consulting Engineer, Vol 39, No 5, p 30-31, May, 1975.

Descriptors: *Treatment facilities, *Waste water treatment, Filtration, Activated sludge, Digestion, Aeration, Automatic control, Butterfly valves, Methane, Sludge disposal.
Identifiers: Norwich(England), River Yare, Flow meters.

The Norwich, Great Britain, sewage treatment plant is currently being remodelled. Integration of the existing plant and the new extensions will provide four parallel treatment streams. In two of the parallel systems, sewage will be treated by biological filtration and activated sludge. The other two parallel systems will process sludge by digestion and pressure filtration. A new inlet works comprised of main flow measuring facilities, duplicate rotating fine drum screens, and duplicate detritors to deal with the whole flow has been constructed. The new activated sludge plant has four radial flow primary settlement tanks and six diffused-air aeration channels. It uses magnetic flow meters and butterfly valves so automatic control can be employed to control the process. The effluent passes to four final radial-flow settlement tanks before discharge into the River Yare. The present sludge digestion system is also being modified. The site services have also been extended. Methane produced by the digestion system is used as the primary fuel for the new boilers. (Dean-FIRL)

**OKLAHOMA PLANS AHEAD FOR WASTE WATER REUSE,**
Benhan-Blair and Affiliates, Inc., Oklahoma City.
D. B. Benham, L. C. Fountaine, and P. Brune.
The American City, Vol. 90, No. 7, p 34-35, July 1975.

Descriptors: *Waste water treatment, *Treatment facilities, Tertiary treatment, Sewage treatment, Nutrient removal, Filtration, Trickling filter, Nitrification, Dewatering, Incineration, Chlorination, Water reuse, Water quality standards.
Identifiers: Effluent standards.

A new municipal waste water treatment facility for Lawton, Oklahoma, has been designed to meet state effluent criteria with less than 15.0 mg/liter BOD21 and phosphorus concentrations under 1 mg/liter. Resultant water of this high quality will be purchased by the electric utility serving the area for cooling use in the generation of electric power. Within the facility, raw sewage will pass through a set of three mechanically-cleaned bar screens for solids removal. Preaeration tanks will operate with a detention time of 58 minutes to provide flocculating action, enhancing the removal of ss in primary tanks, and introducing some dissolved oxygen. Three FMC primary settling tanks will be included, with space allowed for a fourth. Secondary treatment will consist of two steps: carbonaceous treatment with plastic media trickling filters; and nitrification by the activated sludge process. Final clarifiers will remove biological sludge formed from the nitrification tank, using suction type sludge removers rather than conventional scrapers. A tertiary stage will be employed to remove phosphorus from the waste water by chemical precipitation using lime, aium, and coagulant-aid polymers. After chemical phosphorus removal, two-stage recarbonation with intermediate settling filtration through sand anthracite filter beds, and final chlorination disinfection will be accomplished. Sludge from the primary and secondary processes will be dewatered and incinerated; sludge from phosphorus removal will be thickened and stored on site for periodic removal. (Kramer-FIRL)

**ANAEROBIC PROCESSES, (LITERATURE REVIEW),**
Institute of Gas Technology, Chicago, Ill.
S. Ghosh, and J. R. Conrad.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1278-1805, June, 1975.

Descriptors: *Waste water treatment, *Anaerobic conditions, *Anaerobic digestion, Bacteria, Thermodynamics, Denitification, Microbial degradation, Reviews, Fermentation, Methane bacteria, Organic wastes, Industrial wastes, Municipal wastes, *Bibliographies.

A literature review on the subject of anaerobic processes has been prepared. Some of the many studies included: observation of pathways of glutamate fermentation; detection of Na as an obligate growth requirement of several strains of common rumen bacteria; degradation of various organochlorine and organophosphorus insecticides in flooded soils; review of thermodynamics, pathways, and mechanisms of anaerobic fermentation and anaerobic sulfate reduction by bacteria present in marine sediments; effect of facultative growth on the redox potential of the microbial cultures; and study of factors affecting biological dentrification of waste water by pure cultures. It was suggested that more research be conducted on the fundamental microbiology and mechanism of the energy-yielding, hydrolytic, and gas-forming processes in anaerobic waste fermentation. Many investigations describe the role of anaerobic denitrification for nitrogen removal in soil strata used for the treatment and/or final disposal of applied wastes. Design and operation of digestion tanks and related equipment are outlined. Comparisons were also made between several sludge stabilization systems. Specific applications of anaerobic digestion are detailed, such as for food processing wastes, textile wastes, agriculture and livestock wastes, muncipal solid wastes, and landfill leachate treatment. Additionally, the potential for energy reclamation by anaerobic bioconversion of all types of organic wastes to CH4 is under serious consideration. (Kramer-FIRL)

**SLUDGE TREATMENT, UTILIZATION, AND DISPOSAL, (LITERATURE REVIEW),**
Delaware Univ., Newark. Dept. of Civil Engineering.
R. I. Dick.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1306-1323, June, 1975. 255 ref.

Descriptors: *Reviews, *Waste disposal, *Sludge treatment, *Sludge disposal, Reuse, Public health, Toxicity, Heavy metals, Dewatering, Ultimate disposal, Simulation analysis, Incineration, *Waste water treatment, *Bibliographies.
Identifiers: Sludge conditioning, Ocean dumping.

A review of recent literature discusses treatment, utilization, and disposal of sludge. Recycling and landspreading procedures must consider public health and safety before new methods of sludge management will gain public acceptance. Sludge properties, such as viscosity, rate of solubilization of carbohydrates, and chemical composition, have been measured. Recovery of potentially valuable waste constituents, which might also be toxic, is suggested. Of particular interest is heavy metals, and the possibility of recovery by solvent extraction, ion exchange, reverse osmosis, electrochemical methods, adsorption, or complex formation with polyelectrolytes. Water treatment plant alum sludge handling presents another set of alternatives. Sludge conditioning by chemicals and by polyelectrolytes has been investigated. The effect of thickener size on the cost effectiveness of other sludge treatment processes was reported. Sludge dewatering processes were also reviewed, with simulation models and pilot scale tests. Incineration, wet oxidation, and heat drying are viable solutions for disposal in some situations. Reclamation of sludges as fuels is currently under study. Types of ultimate disposal include the controversial ocean dump practices, liquid sludge application of agricultural land, trenching, heat drying and sale as fertilizer, and application to abandoned strip mines. Ecological impact of application must be considered, particularly the sources, fate and effects of trace elements in sludges, when applied to soils. (Kramer-FIRL)

**WASTEWATER COLLECTION, (LITERATURE REVIEW),**
Nottingham (H.D.) and Associates, Inc., McLean, Va.
T. Singh.
Journal of Water Pollution Control Federation, Vol 47, No 6, p 1335-1338, June, 1975. 41 ref.

Descriptors: *Reviews, *Waste water treatment, *Sewers, *Sewerage, *Sewage treatment, Outfall sewers, Maintenance, Combined sewers, Monitoring, Infiltration, Inspection, Inflow, Plastic pipes, Linear programming, *Bibliographies.
Identifiers: Television inspection, Sewer monitoring, Waste water collection.

A review of current literature on waste water collection systems is given. Sewer design was studied, and use of lower per capita flows and a design period of 25 years rather than 50 years were recommended. Models to optimize drainage networks based on linear programming have been developed. Construction details of long outfall seweres are outlined. Combined sanitary and storm sewer plans, aligned by laser light, are also described. Flow smoothing in sanitary sewers has been investigated; holding basins are meant as a supplemental tool rather than a replacement for the conventional gravity system. The use of materials such as polyethylene pipes was also discussed. Infiltration/inflow problems are major areas of concern. Sewer monitoring methods and measuring devices have been tested. Smoke detection of leaks and surface flows has been implemented as has closed circuit TV for sewer inspection. Sewer maintenance, repair, and cleaning are areas of neglect. Attention should be given to preventive maintenance, such as regular hydraulic cleaning, and rehabilitation by slip-lining with ultra high molecular weight polyethylene pipe in the cases of deteriorating concrete pipes. (Kramer-FIRL)

**THE EFFECT OF LEGISLATION OF THE FUTURE USE OF WATER IN THE LEATHER INDUSTRY,**
Water Pollution Research Lab., Stevenage (England).
D. A. Bailey.
Journal of the Society of Leather Technologists and Chemists, Vol. 57, No. 1, p. 5-12, 1973. 4 fig, 4 tab, 5 ref.

Descriptors: *Water conservation, *Tannery wastes, *Waste water treatment, *Standards, Europe, Legislation, Industrial wastes, Sludge disposal, Costs, Water reuse.
Identifiers: *England, *Leather industry.

As the scarcity of water in England and Wales increases its value and in anticipation of stricter standards for effluent disposal by the Region Water Authorities, recommendations are made to the leather tanning industry for water conservation, re-use, and waste treatment. While new water is unlikely to increase production costs, waste effluent disposal costs will have a pronounced effect on production. It is suggested that the industry reduce the total throughput of water by better housekeeping, alteration of processes to use less water, separate cleaner fractions of the waste for direct re-use without treatment, and recycle after complete or partial treatment. Smaller volumes of concentrated wastes would facilitate the application of advanced treat-

ment techniques, such as high-rate biological systems, and this industry's under-exploited, chemical precipitation. Several methods are proposed to reduce water usage. The industry as a whole should establish the optimum water quantity requirements for each state of processing and set target figures at which to aim. Minimum water quality requirements must also be determined for each process. This information will prove valuable if supplies of cheaper second-grade water are made available, inasmuch as in some instances good quality sewage effluent is used industrially. (Auen-Wisconsin)

**BIO-OXIDATION PROCESS SAVES H20,**
Sun Oil Co., Toledo, Ohio.
E. F. Mohler, and L. T. Clere.
Hydrocarbon Processing, Vol. 52, No. 1, p. 84-88, 1973. 1 fig, 9 tab, 10 ref.

Descriptors: *Waste water treatment, *Reclaimed water, *Biological treatment, *Oil, Cooling towers, Cooling water, Industrial wastes, Sulfur, Phenols, *Oxidation.
Identifiers: Oil refineries, Hydrocarbons, *Bio-oxidation.

This process successfully handles oil refinery waste water and conserves fresh water. Water consumption is 214 gallons per barrel (gpb) of crude oil on the national average compared to 28 gallons with this system, and consumption has been further reduced to as little as 17 gpb of crude. The process has evolved from experiments in the Toledo refinery of Sun Oil Company based on the use of cooling towers to provide bio-oxidation of phenolic materials while using the waters for conventional equipment process cooling. The mechanism, design, operation and maintenance data are given. Over 90% of the reaction occurs during the fall through the tower structure. The balance of bio-oxidation is carried out in the cooling tower basin before the water is pumped in the circulating system. Over-all removal exceeds 99.9%. Upflow sand filtration allowed the establishment of a high-solids loading which extends the operating cycle, makes addition of chemicals easier with excellent agglomeration of suspended solids throughout the entire sand bed. Additional reuse from the operation of the sand filter system will reduce consumption below 10 gpb, amounting to a saving of $174,000, plus that required for chemically treating fresh water, for a refinery producing 120,000 barrels per day. **EFFLUENT TREATMENT FOR A SMALL TANNERY,**
Research Advisory Service, Inc., Western Springs, Ill.
H. H. Young.
Journal American Leather Chemists Association, Vol 63, No 8, p 308-315, 1973. 11 fig.

Descriptors: *Waste water treatment, *Tannery wastes, Sludge, Chromium, *Illinois, Recycling, Filters, Treatment facilities.

The described treatment facility was based on standard procedures for handling fluid wastes on a 70,000 gpd volume, fluctuating from 2000-10,000 gallons/hr over a 12-hr period. The tannery used a hair-saving operation, chrome tanning with some vegetable or synthetic re-tan was employed, the waste streams' composition were unvaried but flow distribution was variable. The municipal standards prescribed that at no time could the fat or grease exceed 100 ppm, the chromium exceed 25 ppm, and the pH fall outside the 4.5-10 range. Recovered fats or settleable solids as sludge would have to be separated and hauled away. The system will cost $1 for each gallon of daily flow; for larger units the cost would be proportionately less. A new filtering mechanism separated fine thixotropic solids from the fluids. Demonstrations suggested its possible use for the separation of chromium hydroxide. The Dyno-Filter produced 30 lbs of dewatered cake and 420 lbs of filtrate containing 10 ppm of chromium metal equivalent, from 450 lbs of settled sludge. 450 lbs of spent chrome liquor containing 0.13% chromium as metal yielded 440 lbs of filtrate containing 8.5 ppm of chromium metal and 10 lbs of filter sludge cake containing 5.6% chromium metal, reflecting a 95.5% chromium recovery. **SOME ASPECTS OF A CHEMICAL TREATMENT OF THE WASTE WATERS FROM THE BEAMHOUSE,**
Institute TNO voor Leder en Schoenen, Waalwijk (Netherlands).
A. J. J. van Meer.
Journal American Leather Chemists Association, Vol 68, No 8, p 339-345, 1973. 7 fig.

Descriptors: *Waste water treatment, *Tannery wastes, *Oxidation, Industrial wastes, Organic loading, Sulfides, Manganese, Aeration, Hydrogen ion concentration, Chemical oxygen demand, Nitrogen, Sulfur, Water reuse, Europe.
Identifiers: *Beamhouse liquors, Process modification, Acidification.

Chrome leather tanning waste water contains 75-80% of oxygen consuming substances and nitrogenous materials resulting from the soaking, unhairing, and liming processes. When alkaline liquors are mixed with the acid liquors, the pH is reduced to 8.5-9.5, which precipitates proteins, thus decreasing the pollutants of the mixed and settled waste water by 35-45%. This is accompanied by the formation of large sludge quanties with a water content of 95-98% and is difficult to handle. Moreover, 4000-7000 gals/1000 lbs of hides of waste water has to be treated. Presuming that combined soaking and unhairing can be consistent with good leather quality, three experiments were conducted which indicated that the waste load from soaking and unhairing can be collected in a volume of about 300-500 gals/1000 lbs of hides. The oxidative removal of sulfur decreases the alkalinity of the waste water considerably. When the waste water from the combined soaking and unhairing process is acidified, by a small amount of sulfuric acid, to pH 3.5, the organic matter in the settled effluent is reduced about 90%, resulting in a 58% total waste load reduction. The filtering and dewatering properties of the protein precipitate are very good. The spent lime liquor can be reused. (Auen-Wisconsin)
W75-12120

**SOME ASPECTS OF TANNERY EFFLUENT CONTROL,**
Garden State Tanning Co., Reading, Pa.
S. De Mohan.
Journal of American Leather Chemists Association, Vol 68, No 8, p 316-321, 1973. 4 tab, 9 ref.

Descriptors: *Tanning wastes, *Effluents, *Waste water treatment, *Industrial wastes, Chromium, Water conservation, *Pennsylvania, Sludge.
Identifiers: Beamhouse liquors.

The Garden State Tanning Company, Reading, Pennsylvania manufactures upholstery leather by a chrome tanning method. By adopting the bio-processor water use was reduced and sulfide requirements were reduced by about 40%. Pilot plant experiments with manganese sulfate at the rate of 200 g/cu m as a catalyst in sulfide oxidation by aeration indicated that sulfide can be reduced considerably. After aeration for 8 hours the pH of the liquor was reduced to 9.5 then 10 g alum/gallon was added. When the precipitate was allowed to settle the BOD5 of the liquor was reduced by 77.5% the sludge volume was about 12% of the total volume. To every 45 gallons of exhaust chrome liquor 1.88 lbs lime powder was added then 157.5 g of Primafloc A-10 was added gradually and allowed to stand for 4 hours. The top supernatant liquor can be easily decanted or siphoned off and contains only 0.4 ppm chromium. The pH of the water is 8.2 and the water can be reused in pickling and chrome tanning. The chrome sludge was dissolved in concentrated hydrogen sulfate to convert it to basic chromium sulfate. The pH of the recovered chrome solution was 2.7-2.8. (Auen-Wisconsin)
W75-12123

**NO-EFFLUENT TANNERY PROCESSES,**
Rhodes Univ., Grahamstown (South Africa). Leather Industries Research Inst.
D. A. Williams-Wynn.
Journal American Leather Chemical Association, Vol 68, No 1, p 5-13, 1973. 15 ref.

Descriptors: *Tannery wastes, *Effluents, Sodium chloride, Lime, Industrial wastes, *Waste water treatment, Water reuse, Recycling.
Identifiers: Process modification, Vegetable tanning, Beamhouse liquors, Liritan process, South Africa.

At various stages in the conversion of raw hide to tanned leather, steps can be taken which will result in lower effluent volumes and a reduction in the amount of solids, both in solution and as sludge which needs to be discharged. Salt from curing is a major contributor to the total dissolved solids in effluent and alternatives to salt curing are discussed. Processes in the beamhouse result in the greatest amounts of contaminating substances in tannery effluent, some originating from the hides, while others are from chemicals used in depilation. Excessively large amounts of lime are frequently used by tanners, whereas not more than 2% is adequate for liming and assuring that no undissolved material is left, thus reducing the amount of sludge to negligible proportions. Soluble protein is easily destroyed by aerobic digestion and sulfide is converted to harmless substances by manganese-catalyzed oxidation. The use of closed circulator tanning systems in vegetable tanning ensures that the minimum amount of tannin is lost in discharge into the effluent. The original Liritan process and the Liritan semi-rapid pit/drum process are described, as are the use of low float or nofloats procedures for chrome tanning, retanning, dyeing, and fatliquoring. (Auen-Wisconsin)

EMICAL CHARACTERISTICS OF TED CHEMICAL SEWAGE SLUDGES,
nmental Protection Service, Ottawa o). Water Technology Centre.
Chawla, J. D. Stephenson, and D. Liu.
dge Handling and Disposal Seminar, Con-Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 63-94, (1974) 9 fig, 15 tab.

Descriptors: Treatment facilities, *Sludge, *Nutrient removal, *Waste water treatment, Phosphrus, Nitrogen, Heavy metals, Polychlorinated biphenyls, Pesticides, Organic compounds, Lipids, Aerobic bacteria, Lime, *Canada, Pollutant identification.
Identifiers: *Phosphorus removal systems, Ontario, Biochemical characteristics, Precipitating agents, Petroleum hydrocarbons.

Phosphorus removal systems are being incorporated into many sewage treatment facilities in Ontario. Precipitating agents are ferric chloride, lime or alum. The differences in chemical composition of these phosphorus rich chemical sludges have caused concern about the potential pollution of surface waters and groundwater, as well as of soil and plant systems. An extensive program was started in 1973 to study the biochemical characteristics of these sludges. Samples were taken from four sewage treatment plants over a fifteen month period and analyzed for nutrients and heavy metals, microbial contents, pesticides, polychlorinated biphenyls (PCBs), lipids and petroleum hydrocarbons. The results showed that each plant has to be considered individually due to variations in concentration of the materials studied. The amount of aerobic heterotrophic bacteria was relatively constant. There was a random variation of heavy metals and only one plant had a high concentration of petroleum hydrocarbons. (See also W75-11715) (Dean-FIRL)

VIROLOGICAL INVESTIGATIONS ON SLUDGES FROM SELECTED ONTARIO SEWAGE PLANTS,
Ontario Ministry of Health, Toronto.
T. P. Subrahmanyan.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 95-109, (1974) 7 tab, 9 ref.

Descriptors: Treatment facilities, *Viruses, *Waste water treatment, Sludge, Sewage, Effluents, Sewage treatment, Pollutant identification.
Identifiers: Ontario Ministry of the Environment, Toronto Works Department.

In cooperation with the Ontario Ministry of the Environment and the Toronto Works Department, the Virus Laboratory of the Ministry of Health conducted an investigation of viral isolation in sewage and sludge. Three hundred and fifty three specimens were collected between April and December 1973, from four sewage treatment plants. These specimens included sewage, raw sludge, digested sludge, and effluents. Viruses were isolated in 38.7% of the sewage, 13% of the raw sludge, and 0.9% of the digested sludge samples. During the colder months enteroviruses were rare or absent and reached their peak during August and September. The results showed low viral hazards. Further surveillance and routine monitoring are necessary. (See also W75-11715) (Dean-FIRL)

In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 143-149, (1974).

Descriptors: *Sludge disposal, *Fertilization, Soil science, *Sewage sludge, *Heavy metals, *Pathogenic bacteria, *Nutrients, Crops, Nitrogen, Rates of application.
Identifiers: Land application, Crop quality.

An outline is presented of research being performed at the University of Guelph, Ontario, on the land disposal of sewage sludge. The major objective is to determine maximum rates of sewage sludge application which can be used on agricultural soils without contaminating subsurface water with nitrate nitrogen and surface water with pathogenic organisms, and without lowering the quality of the crops grown. Specific research is being performed to determine rates of sewage sludge which may be safely applied to certain slopes at specified times of the year and to examine the movement of nutrients and other components of sludge on field plots. Field rate and source studies should provide conditions for nutrient, metals, bacteriological and soil characterization studies. Research is being done to determine the application rates of chemically treated sludges which may be used on typical Ontario soils without being detrimental to crop and soil nutrient and heavy metals content. Studies on nitrogen have two objectives: to determine the availability to plants of nitrogen in chemically treated sludges, and to estimate the losses of nitrogen to groundwater. Also, research is being conducted to establish a simple test for plant available metals in soils by selecting suitable extractants with particular emphasis on copper and cadmium, to determine the numbers of total coliforms, fecal coliforms and fecal streptrococci in the sludges, and to characterize the soils in terms of soil structure and movement of Ca, Fe, and Al used in sludge treatment. In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 185-191. (1974) 1 fig, 2 tab.

Descriptors: *Sludge disposal, *Fertilization, *Bioindicators, *Pathogenic bacteria, Runoff, Salmonella, Shigella, Public health, Water pollution sources, Canada.

Research being conducted at the University of Guelph, Ontario, on land disposal of sewage sludge includes studies to establish the numbers of some groups of indicator bacteria in run-off waters and sludges, and to determine the presence or absence of pathogens such as Salmonella and Shigella in sludges, run-off waters and on plants harvested from areas receiving sludge. Examination was made of sludge applied, runoff from control and treated plots, and plots growing corn and grass. Preliminary observations include: the examination of sludge and run-off water for the estimation of commonly employed indicator organisms has little value in assessing the influence of

sludge on run-off water; the number of Salmonella and Shigella bacteria found in sludge and run-off water appears to be quite low; and, some Salmonella and Shigella forms seem to be capable of surviving for a short time in sludge and sludge-soil mixtures. (See also W75-11715) (Orr-FIRL)

In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 249-266. (1974) 6 tab, 12 ref.

Descriptors: *Sewage sludge, Land, *Metals, Soil texture, Canada, Waste water treatment.
Identifiers: Ottawa.

There has been evidence primarily from England that the use of sewage sludge on farmland can result in trace metal pollution. The Soil Research Institute, Ottawa, Canada, has conducted studies on the solubilities of sludge metals in soils. Six acid soils with wide ranges of organic matter and clay content were used. Five anaerobic digested sewage sludges from various points in Ontario were incubated and mixed with the soil. The sludges were iron chloride treated sludges from two different locations, alum treated sludge, untreated sludge, and a lime treated sludge, each from a different location. The extractable metals were measured either before and/or after incubation in 0.05M EDTA, 0.005 DTPA, and 0.01M CaCl2. Increased levels of extractable metals seemed related to the addition of sludge. A large increase in soil pH was caused by adding the lime treated sludge. Although soil texture affected the extractability of zinc it did not appear to do so with other metals. Descriptors: *Bacteria, *Activated sludge, *Waste water treatment, Infection, Pseudomonas, Biodegradation, Detergents, Analytical techniques, Bioindicators, Pollutant identification.
Identifiers: OECD Confirmatory Test Procedure, Bacillus spp., Air-borne bacteria.

The OECD (Organization for Economic Cooperation and Development) Confirmatory Test Procedure is routinely used for testing the biodegradability of detergents in a modified Husmann Apparatus. Laboratory experiments were conducted to investigate the self-infection processes by air-borne bacteria. The system does not need to be inoculated by bacteria from an outside treatment plant; the activated sludge can form its own flora by self-infection of air-borne bacteria. As an open continuous culture fermenter, the OECD system tends towards a "flow-balance" within the first 72 hours. The flow-balance is affected by physicochemical and biological factors such as temperature, pH, nutrients, microbial antagonism, symbiosis, and metabiosis. More than half of the bacteria isolated and identified belonged to the genus Pseudomonas. The majority of the remaining bacteria were Bacillus spp. The results of the experiments were reproducible. **FACTORS AFFECTING OXYGEN TRANSFER DURING BUBBLE AERATION UNDER LABORATORY SCALE CONDITIONS,**
Iowa Univ., Iowa City.
C-Y. Huang.
Available from University Microfilm Inc., Ann Arbor, Michigan, 48106. Order No. 75-13765, PhD Thesis, 1974, 109 p.

Descriptors: *Oxygen, *Waste water treatment, Suspended solids, Electrolytes, Surfactants, Dissolved oxygen, Oxygenation, Water treatment.
Identifiers: *Oxygen transfer rate, Surface active agents.

Factors affecting oxygen transfer from air into liquid, such as inorganic electrolytes, suspended solids, and surface active agents, were studied in laboratory scale tanks. The effects were expressed by the alpha prime factor which is defined as the ratio of (K sub L)a in solution to (K sub L)a in demineralized water. The alpha prime factor increased in the electrolyte concentrations. The presence of suspended solids in the solution decreased the oxygen transfer rate. Significant decreases were observed with bentonite, asbestos fibers, and activated sludge. The combination of the additives produced a different effect as compared to the effect of the additives alone. A combination of the surface active agent and suspended solids produced a smaller decrease in the oxygen transfer rate than when either additive was present alone. The inorganic electrolyte increased the oxygen transfer rate but when it was present with the surface active agents, a larger decrease occurred. The effects of the additives were analyzed by considering the change of water molecular structure, hydrodynamics of the solution, and the interaction between the additives. The magnitude of the effect of each substance was not a simple function of substance or ionic concentration but also involved the orientation of water molecules and the nature of the substance. The saturated oxygen concentrations were also evaluated. (Orr-FIRL)

**ADSORPTION OF POLIOVIRUS ONTO ACTIVATED CARBON IN WASTEWATER,**
Baylor Coll. of Medicine, Houston , texas. Dept. of Virology and Epidemiology.
C.P. Gerba, M. D. Sobsey, C. Wallis, and J. L. Melnick.
Environmental Science and Technology, Vol 9, No 8, p 727-731, August, 1975. 8 fig, 4 tab, 19 ref.

Descriptors: *Waste water treatment, *Activated carbon, *Adsorption, Hydrogen ion concentration, *Sewage treatment, *Viruses, Acidity, Coagulation.
Identifiers: Lime coagulation, Batch studies, *Poliovirus, Viral removal, Freundlich isotherms.

An investigation was made to determine how to optimize activated carbon adsorbion of viruses from treated sewage. Poliovirus removal from sewage effluents was improved significantly (by about 25 times) by lowering the pH from near neutral (8) to 3.5-4.5 or by reducing the concentrations of soluble organic matter by lime coagulation. However, further study is required to determine if carbon column operation under acidic conditions would be economically feasible and practical. Batch studies showed that Freundlich isotherms could be used to describe virus adsorption to activated carbon. Column studies indicated that viral removal efficiency was dependent on column length and hydraulic loading, with greater removals at lower loading. (Kramer-FIRL)

**BIOLOGICAL WASTE WATER TREATMENT,**
T. Yamauchi, and K. Matsumoto.
Mitsubishi Juko Giho, Vol 12, p 118-124, January, 1975. 11 fig, 12 tab, 11 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, *Trickling filters.
Identifiers: *BIO-PAC Process, Japan.

Various biological methods for waste water treatment have been developed. The most widely used biological method is the activated sludge process. A description is given of a new process for the treatment of waste water containing a high concentration of salt. One problem with activated sludge treatment is the development of bulking which prevents the waste water from being treated. In this case a trickling filter is required. A new process, the Mitsubishi BIO-PAC Process, has been developed for the treatment of waste water when bulking is a problem. The results of application of this new BIO-PAC Process are also discussed. (Orr-FIRL)

m/hr so that smaller, more economical
n the usual settlement tanks can be con-
The advantages of flotation include its
ity to a wide range of application, its flex-

ibility in operation, and its rapid plant start-up and shut-down. Coagulation and flocculation are required for the effective removal of color and colloidal matter. The use of microbubbles in the flotation system produces a smaller floc which reduces the time needed for flocculation as compared to a settlement system. Compressed air is dissolved in a small quantity of recycled water at pressures at or above 4.0 atmospheres. The saturated air/water solution is released under controlled conditions in the flotation tank to produce a cloud of microbubbles which envelops the solids in the feed flow. Studies using a pilot water treatment plant incorporating chemical treatment, flocculation, flotation, and filtration have substantiated the viability of flotation as a primary solids/liquid separation process. A typical process flow diagram for primary solids/liquids separation by flotation is presented. (Orr-FIRL)

**PRINCIPLES AND TECHNIQUES FOR CONDITIONING OF WASTE-ACTIVATED SLUDGE BY DIRECT SLURRY FREEZING,**
Virginia Polytechnic Inst. and State Univ., Blacksburg.
M. Z. A. Khan.
PhD Thesis, 1974, 256 p.

Descriptors: *Waste water treatment, *Sludge treatment, *Freezing, Dewatering, Domestic wastes, Industrial wastes, Pulp and Paper industry, Filtration, Costs, *Activated sludge.

Direct slurry freeze conditioning of waste-activated sludge achieves a significant improvement in dewatering. Dewatering characteristics were defined by the specific resistance and coefficient of compressibility values, by settling, and by filter cake quality when vacuum filtration and gravity drainage on sand beds were used. Sludge samples were taken from plants treating domestic sewage, combined industrial wastes and domestic sewage, and pulp and paper wastes. Direct microscopic and wet sieve analysis indicated that the primary mechanism of conditioning was the promotion of flocculation by freezing. The degree of conditioning is a function of the 'butane contact' or freezing time with better conditioning occurring with longer detention times. The direct slurry freezing process is more economical than other sludge conditioning processes such as direct freezing and heat treatment. The estimated cost per ton of dry solids processed was $6-20. (Orr-FIRL)
W75-12154

**THE INFLUENCE OF OXYGEN CONCENTRATION AND TURBULENCE INTENSITY ON COMPLETE-MIX ACTIVATED SLUDGE PERFORMANCE,**
Vanderbilt Univ., Nashville, Tenn.
A. J. Englande, Jr.
PhD Thesis, 1974, 178 p.

Descriptors: *Waste water treatment, *Activated sludge, Mixing, Oxygenation, Phenols, Pilot plants, Laboratory tests, Oxygen requirements, Dissolved oxygen.
Identifiers: Complete-mix activated sludge, Floc characteristics, Oxygen utilization, Food/Microorganism ratio.

The relationships between oxygen concentration, turbulence intensity, and pertinent process parameters in a complete-mix activated sludge 10 gpm pilot plant treating a phenol waste water were studied. Bench-scale studies were conducted to determine the effect of other factors, such as food-to-microorganism ratio (F/M), the nature of the substrate, the nature of the turbulence, and solids concentration, on the floc size and consequently on the oxygen transfer efficiencies. Bench-scale models are capable of simulating prototype performance as expressed by kinetic substrate removal rate, oxygen uptake rate, floc size, and dehydrogenase activity. Substrate removal for the phenol sludge substantially decreased below a critical oxygen concentration of 0.5 mg/liter DO. Floc size was a function of the nature of the turbulence, the mixing intensity, the nature of the substrate, and the F/M loading. The scale of turbulence must be similar to that of the floc particles to influence floc size. A mixing intensity increase corresponded to a decrease in floc size. The flocs were essentially filament-free and their sizes were small enough so that oxygen diffusion could not be limiting. Two oxygen utilization rate monitoring methods, the DO probe and the off-gas analysis, produced the same results. The oxygen uptake test is an adequate substitute for monitoring bioactivity because of the observed linear relationship between dehydrogenase activity and DO uptake; both parameters increased in value with increasing loading rate. (Orr-FIRL)

**MATHEMATICAL MODELS AND SIMULATION OF WASTEWATER TREATMENT SYSTEMS,**
Tokyo Sewerage Bureau (Japan).
M. Koide, S. Nogita, M. Tanuma, and M. Shioya.
Hitachi Review, Vol. 24, No. 1, p 49-55, January, 1975. 11 fig, 2 tab, 12 ref.

Descriptors: *Waste water treatment, *Mathematical models, Activated sludge, Water quality, Sewage, Model studies, Computers, Simulation analysis.
Identifiers: *Japan, Computer control, *Tokyo(Japan).

In hierarchical multilevel control systems for waste water treatment, computer control achieves mode changing and parameter correcting to effect feed-forward, optimum, and adaptive control. However, advances in this field have been impeded by difficulty in defining the characteristics of the activated sludge treatment process. Hitachi, Limited, in conjunction with the Tokyo municipal authorities, is studying and developing mathematical models for influent volumes in waste water treatment systems and water quality, and is observing their accuracy at the Mikawashima Sewage Treatment Plant of the Sewerage Bureau of Tokyo Metropolitan Government. New control systems are being discovered through the use of these models, which include a sewage inflow prediction model, an aeration tank model, a final clarifier model, static simulation, and dynamic simulation. **WASTE DISPOSAL SYSTEM,**
Standard Products Co., Cleveland, Ohio. (Assignee).
J. S. Reid.
U.S. Patent No 3,898,161, 5 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 937, No 1, p 202, August 5, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Water pollution control, Domestic wastes, Waste disposal, Heat transfer, Flash distillation.
Identifiers: Vaporization, Sterilization.

The disposal of liquid and organic human bacteriological waste material by vaporization described. The system has vaporizing means comprised of a boiler which is heated. Liquid and organic human bacteriological waste material is metered into the heated boiler for vaporization and sterilization. The interior walls of the boiler become caked with ash and mineral residue which greatly reduces the efficiency of heat transfer. Such deposits must be cleaned at periodic intervals in order to maintain optimum efficiency of the system. The system includes an arrangement for shutting off waste material and starting flow of fresh water to sweep deposits from the vaporizer. Introduction of fresh water causes the fresh water to flash into steam for helping break deposits from

the internal walls. The caked deposits are then swept from the boiler when the fresh water exhaust line is open. The entire internal peripheral surface of the boiler is coated with a non-stick material such as polytetrafluorethylene. (Sinha-OEIS)

**OVERLAND FLOW: ANSWER TO WATER CLEANUP CHALLENGE.**
Louisiana State Univ., Baton Rouge. Office of Sea Grant Development.
Aquanotes, Vol 4, Issue 1, p 3-4, March 1975. 2 p, 1 photo.

Descriptors: *Sewage, *Overland flow, *Sewage bacteria, *Sewage disposal, *Sewage treatment, Wastes, Domestic wastes, Sanitary engineering, Sewage effluents, Water pollution, Water pollution sources, Environmental sanitation, Waste water disposal, Waste water(Pollution), Microorganisms, Microbial degradation, Biodegradation, Tertiary treatment, Water pollution treatment, Discharge(Water), Research and development, Marshes, Spoil banks.
Identifiers: *Hazardous substances(Pollution), Environmental policy.

Researchers are studying the feasibility of putting the nutrient materials in sewage back to work, while making water supplies cleaner and safer for human use. This article discusses a technique called overland flow, which is currently being investigated. This technique could save state industries millions of dollars, while simultaneously making beneficial use of dredge spoil banks. Because of the enormous costs of tertiary treatment of waste water, scientists are investigating the use of a marsh to effect a natural clarification. The overland flow technique involves application of effluents on the soil surface. Purification and removal of nutrients is accomplished through natural activity of microbes and the plant community, under suitable land conditions. The article continues with a more detailed explanation of the process and concludes that the findings as a result of this project may offer a more economical alternative to sewage waste treatment. **MARITIME ADMINISTRATION PROPOSED SHORE FACILITY FOR TREATMENT AND DISPOSAL OF SHIP GENERATED OILY WATER WASTES.**
Maritime Administration, Washington, D. C.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-AA-73-1850-F, $5.25 in paper copy, $2.25 in microfiche. November 1973. 120 p, 2 map, 3 tab, 19 ref, 2 append.

Descriptors: *Oil wastes, *Oily water, *Water quality, Water, Wastes, Ships, Water quality control, Virginia, Fuels, Barges, Marine biology, Environmental effects, Oil spills.
Identifiers: *Environmental impact statement, *York County(Va).

The Maritime Administration proposes to lease to the Virginia Port Authority the surplus fuel farm portion of the U. S. Navy Complex, known as Cheatham Annex, located in York County, Virginia, for processing oily water wastes from ship's tanks, bilges and ballast operations. The oily water wastes will be transported by barge from the ships in the Hampton Roads area to the processing facility. Historically, it has been the practice to discharge oily bilge and ballast waters into the open oceans, territorial seas, and coastal and harbor waters. The proposed project will be beneficial in providing a facility where oily water wastes can be collected and treated prior to discharge into the York River. The expected adverse environmental impacts of the project include an increase in barge traffic on the York River between the facility and the Hampton Roads area and the creation of oily odors in the vicinity as a result of the treatment process. Additionally, solid wastes from the treatment process will have to be disposed of and measures will have to be taken to alleviate oil spills due to barge collisions, the loading or unloading process or through error at the treatment facility. The following alternatives were considered: use of another land-based facility; use of a floating facility; equiping of vessels with devices for separating oil from water; and no project. (Gagliardi-Florida)
W75-12256

**MAMALA BAY WASTEWATER TREATMENT AND DISPOSAL SYSTEM, OAHU, HAWAII (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Environmental Protection Agency, San Francisco, Calif. Region IX.
National Technical Information Service, Springfield Va 22161, USDC, as EIS-HI-74-0011-F, $9.25 in paper copy, $2.25 in microfiche. January 2, 1974. 319 p, 24 fig, 23 tab.

Descriptors: *Waste water treatment, *Waste water disposal, *Water quality control, Estuaries, Hawaii, Waste treatment, Water, Disposal, Treatment, Treatment facilities, Water quality, Water quality standards, Estuarine environment, Wastes, Environmental effects, Dusts, Turbidity, Pollutants.
Identifiers: *Environmental impact statement, *Mamala Bay, Oahu(HI).

The proposed action involves construction of a regional wastewater treatment and disposal system to serve the Mamala Bay area of Oahu, Hawaii. The area will be served by two unconnected collection treatment and disposal systems which are designed to improve coastal and estuarine water quality. The discharge of 55 mgd of raw wastes off Sand Island and 14 mgd of inadequately treated wastes into Pearl Harbor will be eliminated. Project construction will result in a number of short-term minor adverse impacts. These include noise, dust, inconvenience to residents, removal of limited acreage from agricultural production, and turbidity and disturbance of benthic organisms in underwater sections. The project will support continued urbanization of the area and will aid in increasing sources of air, water and noise pollution and congestion. Alternatives considered included construction of only one plant and one outfall, and no construction. (Gagliardi-Florida)

**THE $5 BILLION FLUSH.**
Congressional Record, Vol 118, p E 7145 (daily ed. July 27, 1972). 1 p.

Descriptors: *Sewage treatment, *Water treatment, *Potable water, Legislation, Water pollution control, Water quality, Water quality control.
Identifiers: Emergency community facilities, Public Investment Act, Revenue sharing.

Representative John E. Hunt of New Jersey commended his fellow Representative who voted down the Emergency Community Facilities and Public Investment Act of 1972. This bill would have authorized the Secretary of Housing and Urban Development to commit up to $5 billion for water and sewer projects in communites with substantial unemployment. Such a bill, its backers felt, would put people back to work, give cities essential public works, and lift financial burdens from the budgets of little towns. According to Mr. Hunt, however, it was a redundant, inflationary measure. He pointed to the fact that there was al ready an $18 billion, 3-year water pollution contro bill in conference. The Representative also in troduced into the Record a Washington Post edi torial which conveyed the same message. The Pos editorial found the bill lacking in fiscal respons bility, especially in light of the fact that th backlog of pending water and sewer grants is onl $2 billion. (Hoffman-Florida)

US Patent No 3,899,423, 7 p, 4 fig, 9 ref; Offic Gazette of the United States Patent Office, V 937, No 2, p 632-633, August 12, 1975.

Descriptors: *Patents, *Sewage treatment, *Wa water treatment, *Water pollution control, M ing, Biodegradation, Filtration, Oxygenati Coagulation, Disinfection, Equipment.
Identifiers: Small volume sewage system, Porta system.

A process and a system is described for carry out the process which accomplishes biologi digestion of sewage in a small volume followed chemical treatment to assure that all effluent safe for discharge. The system can be adapted use in watercraft, mobile equipment and wh sewage treatment facilities are not available. T system includes the means for receiving, mace ing and delivering the sewage to a mixing tank at least one settling tank connected to the mix tank for the separation of solid sewage from liq sewage. A filter tank receives clarified sew from the settling tank. A coagulant is injected the mixing tank and the settling tank. Oxygen is jected into the mixing and settling tanks and b tericide is injected in the filter tank. The vane the mixing tank are placed so as to cause turbul flow to direct heavy solid particles to the bot of the tank for bacterial digestion and to direc cloud of floculated sewage to the bottom of tank. Pockets of oxygen beneath the vanes prov constant contact between oxygen and the sew under treatment. (Sinha-OEIS)

vage treatment, *Water pollution treatment,
ter pollution control, *Water quality control,
lation, Microbial degradation, *Irradiation,
mical degradation, Equipment.

microbiological and chemical activity of water
aining microorganisms and other impurities is
ced by irradiating such water with high energy
trons. A device mixes the water with a gas to
ly the water with oxygen and the water passes
ugh a constricted region where the electron
n irradiates the water. The conduit for the
r is an enclosure which includes a narrow
llic duct of extended cross section, having at
one extended end formed of a thin walled re-
permeable to high energy electrons. By hav-
he duct in the region of the high energy elec-
beam, economics in pumping power are
eved while providing the desired high velocity
luid flow. Before the water is irradiated, it
es through a region where a gas is injected into
water to reduce the density of the water. The
as mixture increases the effective size of the
area which further economizes the operation
ermitting the use of lower energy electrons.
n the gas contains oxygen, the contaminated
r receives oxygen and desirable oxidation oc-
at the time of irradiaton or shortly after.

**NEW ORLEANS CHOOSES OXYGEN ACTIVATED SLUDGE.**
Civil Engineering, ASCE, Vol 45, No 6, p 84, June, 1975.

Descriptors: *Waste water treatment, *Activated sludge, *Sewage treatment, *Construction costs, Treatment facilities, Pilot plants, Biochemical oxygen demand, Oxygen costs, *Louisiana.
Identifiers: Secondary treatment, New Orleans (La), Oxygen activated sludge.

A secondary treatment plant is being built to handle New Orleans waste water. Because this is a new facility, a choice existed between air activated sludge and oxygen activated sludge. With air activated sludge, reductions in BOD and SS were predicted at 85%. In a pilot test of an oxygen system, BOD removals were 90-95% and SS removals were 87-93%. Thus, the oxygen activated sludge process was implemented, and will be complete in 1976. Advantages of the oxygen method are that it requires less aeration tank space; it can handle more variation in flow rate, sewage strength, and storm flows; it utilizes covered aeration tanks, eliminating hazards of splashing, aerosols, and odors; and costs will be lower. Disadvantages of the system are that preventive measures must be taken against leaks; careful selection of metals must be made, as oxygen is corrosive to many metals; and about every two years, on-site generators will have to be repaired and/or overhauled, necessitating temporary and expensive trucked-in oxygen. The new facility will require on-site oxygen generation using two 70 ton cyrogenic generating units. Plant costs will be about $29 million, or about $240,000 per mgd treated effluent. (Kramer-FIRL)

**MINNEAPOLIS KEEPS ON TRUCKIN',**
Minneapolis Water Works, Minn.
C. O. Taflin, N. F. Weber, A. J. Kramer, and J. Whitaker.
Water and Wastes Engineering, Vol 12, No 5, p 24-29, May, 1975. 3 fig, 3 tab.

Descriptors: *Treatment facilities, *Waste water treatment, *Dewatering, Sludge treatment, Construction, Lime, Economic feasibility, Magnesium, Polymers, Testing, Minnesota, Calcium, *Recycling.
Identifiers: Minneapolis (Minn), Sludge storage, Tanks, Lime recycling.

Minneapolis has instituted a three part program for pollution control of its water works, which includes recycling filter washwater, construction of a sludge dewatering plant, and an investigation to determine the feasibility of lime recycling. The sludge dewatering plant is a building in two parts, a single story low portion which is made of face brick with concrete block backing, and a higher portion which is insulated sandwich paneling over a structural steel frame. The earth color scheme and attractive landscaping give it an acceptable appearance. The building which houses the water softening opeation contains the office of the management of the complex. Two steel tanks were provided for in-process sludge storage. The larger is outdoors, and the smaller (used for polymer storage) is indoors. A 1500 KVA substation was constructed to power the plant. The plant is expandable to house a future calcining operation. The major mechanical failure during the first 1 1/2 years of operation was leakage from the sludge tank sludge gates, which were replaced. Also, freezing of the sludge cake in the surge tank occurred during plant start up. By increasing lime dose in the softening plant this problem was solved. The feasibility of lime recycling with the standard lime-alum softening treatment was investigated. It is economically feasible only if the purchase of lime and CO2, and dewatering trucking are eliminated. Experimentation was begun on a lime-magnesium biocarbonate softening process. No conclusive data is available; further testing with magnesium will include the use of polymers. (Murphy-FIRL)

**NUTRIENT REMOVAL IN BIOLOGICAL SYSTEMS,**
Pretoria (South Africa).
J. L. Barnard.
Water Pollution Control, Vol 74, No 2, p 143-154, 1975. 11 fig, 1 tab, 24 ref.

Descriptors: *Nutrient removal, *Waste water treatment, *Biological treatment, Nitrogen, Phosphorus, Nitrification, Denitrification, Activated sludge, Precipitation (Chemical), Sludge treatment, Aeration.
Identifiers: *Bardenfo process, Phosphate removal, Solids retention time (SRT), Physico-chemical treatment.

Purely biological methods of nutrient removal are discussed. Removal of nutrients may be due to sludge synthesis or to wastage and the amount is dependent to a large degree on whether the assimilated nutrients in the waste cellular material are returned to the aeration basin. Fixed-media denitrification and suspended media dentrification systems are detailed. A modified activated sludge plant to remove nitrogen through nitrification/denitrification was developed, called the Bardenfo process. In this method, the need for methanol addition is eliminated but the basin size must be increased. Nitrates are used as a source of oxygen, and less sludge, which is more stable, is produced by a long solids retention time (SRT). If the Bardenfo method were applied to an extended aeration plant, costs would include partitions and an additional pump for recycling mixed liquor. These costs would be offset by savings in power due to no necessary increase in the basin size. Phosphorus precipitation in the final clarifiers of some activated sludge plants to which no chemicals have been added has been attributed to several factors. It seems that phosphate removal is greater with a low MLSS in the aeration basin and a low SRT. It has also been postulated that an increased pH is responsible for precipitation of phosphate. It was concluded that additional research is necessary to provide for better biological systems of nutrient removal without the use of expensive physico-chemical methods. (Kramer-FIRL)

**COLUMN SETTLING TESTS FOR FLOCCULANT SUSPENSIONS,**
Envirex, Inc. Milwaukee, Wis. Environmental Science Div.
A. E. Zanoni, and M. W. Blomquist.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE3, p 309-318, June, 1975. 7 fig, 7 ref, 3 append.

Descriptors: *Waste water treatment, *Laboratory tests, Sedimentation, Columns, Plastics, Suspensions, Suspended solids, Sampling, Settling basins, Analytical techniques, *Pollutant identification.
Identifiers: Column settling tests, Flocculant suspensions.

The sedimentation process is used in almost all waste water treatment and many water purification plants. No one design approach can be used for all applications. The settling behavior of flocculant suspensions is not amenable to a mathematical description. It is necessary to employ a settling test in order to predict the performance of a settling basin. A recommended standard column settling procedure for suspensions with 2,000 mg/liter solids is as follows: construct a 2.67 in settling column out of 100 m ID clear plastic with wall thickness of 6.3 mm: drill eight 13 mm holes in a straight line at 0.3 m intervals along column length, beginning with first hole 0.38 m from top; insert and seal 13 mm OD by 6.3 mm ID clear plastic nipples 50 mm long each hole, making certain they do not extend beyond the inside face of the column; attach a 76 mm length of latex tubing on each and seal ends with pinch clamp; seal column bottom with clear plastic disk (wall thickness of 13mm); tap center of disk with a 19 mm pipe thread and insert a 19 mm galvinized nipple and brass gate valve with a 19 mm threaded outlet for a garden hose; support columns to wall tightly; place 25 liters of waste water in a 0.08 cu m plastic garbage can; stir; bring to room temperature quickly; pump test liquid into column using the open gate valve (leaving the stirrer on); close valve and let suspension stand 5 minutes; start timer and sample from each port from top down, then sample again after 25, 50, 75, and 100 minutes; proceed with suspended solids analyses; calculate percentage suspended solids removal values; plot removal values at appropriate depth and settling times; interpolate between plotted values to construct 130 percentage removal lines. (Murphy-FIRL)

**THE EFFECTS OF AEROBIC AND ANAEROBIC INCUBATION ON THE EXTRACTABILITIES OF HEAVY METALS IN DIGESTED SEWAGE SLUDGE,**
Rothamsted Experimental Station, Harpenden (England).
C. Bloomfield, and G. Pruden.
Environmental Pollution, No 8, p 217-232, 1975. 10 fig, 1 tab, 16 ref.

Descriptors: *Heavy metals, *Extraction, *Aerobic treatment, *Anaerobic treatment, Zinc, Nickel, Copper, Lead, Cadmium, Chromium, Sludge, Solubility, Sewage, Hydrogen ion concentration, Lime, *Waste water treatment.

The solubilities of Zn, Ni, Cu, Pb, Cd, and Cr in sludge were investigated as affected by aerobic and anaerobic incubation. Digested sludge from the Upper Tame Drainage Authority, Great Britain was used as taken from the drying bed. Variation in pH of the digested sludge during various treatments was shown graphically. Wide variation in the extractability of the metals as well as in the reagents commonly used to assess availabilities of trace metals to plants, such as acetic acid and EDTA, were found. This extractability may increase or decrease, depending both on whether the conditions are anaerobic or aerobic and upon the element and the extractant. No consistent trends were found in the addition of soil and/or lime to sludge as it related to solubilities of these metals during aerobic incubation. (Prague-FIRL)

**BIOLOGICALLY MEDIATED INCONSISTENCIES IN AERATION EQUIPMENT PERFORMACE,**
Eimco Corp., Salt Lake City, Utah.
O. E. Albertson, and D. DiGregorio.
Journal Water Pollution Control Federation, Vol 47, No 5, p 977-988, May, 1975. 9 fig, 5 tab, 4 ref.

Descriptors: *Waste water treatment, *Aeration, *Activated sludge, Dissolved oxygen, Bubbles, Costs, Equipment, Treatment facilities.
Identifiers: *Oxygen transfer.

The basic methods used to evaluate the performance of aeration equipment are based on classical aeration theory which states that oxygen transfer is a function of dissolved oxygen (DO) driving forces and the overall transfer coefficient of the physical- liquid system only. However, performance data suggests that this basis is incorrect. Aerator efficiency, corrected to standard conditions, has been shown to be directly related to activated sludge respiration rate. Steady-state oxygen transfer evaluations were performed at several full-scale activated sludge plants. These demonstrated a relationship between mixed liquor uptake rate and the measured standard oxygen transfer capacity. The direct transfer of oxygen from gas bubbles present within the mixed liquor to the microorganisms is concluded to be responsible for this phenomenon. The evidence shows that oxygen is available not only through the two-film oxygen diffusion pathway of classical theory, but also by direct transfer of oxygen from air bubbles to the active mass. Activated sludge system design should be modified to take advantage of direct bubble contact. This would achieve savings in capital and operating costs. (Orr-FIRL)

**ENERGY CONSERVATION: AN ESSENTIAL AND URGENT PROBLEM FOR THE WATER INDUSTRY,**
Wessex Water Authority (England). Avon and Dorset Recovery Div.
J. A. Young.
Water, No 3, p 12-14, April, 1975. 3 fig, 5 ref.

Descriptors: *Water treatment, *Sewage treatment, Filters, Oxygenation, Activated sludge, Sewage disposal, Methane, Sludge digestion, *Waste water treatment.
Identifiers: *Energy conservation, Water industry.

Water authorities as well as other industries are now confronted with the urgent and essential need to conserve energy. The water industry has its peak electricity demand during the summer as opposed to the general peak demand during the winter months. The advanced technology in treatment of water and sewage has proven to be more energy consuming than older methods. The slow sand filter method of water treatment which from a bacteriological viewpoint produces a better filtrate than the newer more energy consuming rapid gravity filter is regaining favor. The traditional rotary biological filters used in sewage disposal operated on gravity but have been replaced by oxygenation ditches, and activated sludge which require energy. Sewage disposal at sea could provide an energy conserving, efficient method of disposal in coastal areas. At the Essex Water Authority's Avonmouth Recovery Works the methane gas produced by sludge digestion in producing 55% of the electricity used to power the works. (Dean-FIRL)

**RECENT DEVELOPMENTS OF INSTRUMENTATION, CONTROL AND AUTOMATION SYSTEMS FOR WASTEWATER TREATMENT SYSTEMS,**
Tokyo (Japan). Sewerage Bureau.
S. Kato, K. Kinbara, and T. Oto.
Hitachi Review, Vol 24, No 1, p 35-48, January, 1975. 22 fig, 5 tab, 31 ref.

Descriptors: *Waste water treatment, *Computers, *Activated sludge, *Control systems, Flow control, Analytical techniques, *Instrumentation, Flow measurement, Sludge treatment, Pumps, Equipment, Pollutant identification.
Identifiers: *Japan, Energy consumption.

A review of the development of modern waste water treatment and control systems in Japan is presented. This includes field type digital controllers as well as computer control systems with man/machine/process interfaces. Control systems for machinery and drive, with energy saving as a goal have been improved. Instrumentation being manufactured by Hitachi includes the large-bore electromagnetic flow meter, a sludge settling rate meter, a respiration rate meter, and a total organic carbon/total nitrogen analyzer. Minor control systems for unit operations of the activated sludge process are described. Such systems are a dissolved oxygen concentration/air flow control, a MLSS/return sludge volume control, and a sludge age/drawing volume of excess sludge control. Computer control systems have been designed for effluent quality control and for centralized supervision. Control of machinery and power consumption is effected by aeration blowers, and by pumps for waste water, rainwater, and sludge. (Kramer-FIRL)

**ORGANIC RESIDUE IN A RECYCLED EFFLUENT, PART I,**
Utah State Univ., Logan.
V. D. Adams, E. J. Middlebrooks, and P. D. Nance.
Water and Sewage Works, Vol 122, No 6, 82-84, June, 1975. 7 fig, 2 tab.

Descriptors: *Water reuse, *Waste water treatment, *Organic compounds, Chlorine, Analytical techniques, Chemical analysis, Carbon, Effluents, *Recycling.
Identifiers: Physical treatment, Organic residues.

Use of recycled effluent from a waste water treatment facility, for flushing purposes has been proposed. Such a system consists of utilizing physical treatment in conjunction with a catalyzed hypochlorite generating waste water treatment process. One difficulty of this is the accumulation of organic compound residue in the recycled effluent. An investigation using sophisticated chemical detection techniques was carried out to identify the compounds that accumulated in recycled effluents at a package treatment plant such as for a recreation area. Total and inorganic carbon concentrations were measured; over 60 percent of the carbon was in the organic form. Ether and chloroform extractions were completed with the various peaks in the infrared and nuclear magnetic

nce spectra identified. Extractions were nade of houseboat effluent, obtaining a NMR spectrum. It was concluded that the conditions used for sewage effluent ent, the majority of the excreted nitrogen unds should be oxidized to lesser com- ts. Most organic species should be treated lorination. Some free radical chlorination proceed on alkane species present in the ef- with alkene type compounds to be readily ted by chlorine to saturated compounds ning two atoms of chlorine attached to ad- compounds. fiers: *Recreational waters.

reasons for the necessity of disinfecting tional and potable water supplies are out- The chief reason is the fact that enteric genic bacteria are carried by water and will minate the aquatic environment. Some of the ntly held standards for recreational water quality are based on the fecal coliform count since this nonpathogenic bacteria is associated with the more difficult to isolate Salmonella. However, the recent information concerning the carrying of resistance factors (R factors) by coliforms may result in a change in the current water standards. Disinfection of waste water may be accomplished by using chlorine, bromine, iodine, ozone or ultraviolet light. Chlorine disinfection is the most widely used method. The medical consensus in Canada is that chlorination of waste water discharged to recreational water is essential. Chlorination is also the current most feasible method of disinfecting potable water. A few of the factors which influence the efficacy of chlorine disinfection include: the level of SS; ammonium content; pH; nitrites; iron; and, reaction time. (See also W75-12350) (Orr-FIRL)

**MUNICIPAL SEWAGE TREATMENT TO PROTECT SHELLFISH GROWING WATERS,**
Environmental Protection Service, Vancouver (British Columbia). Pacific Region.
T. J. Tevendale.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 153-170. 3 tab, 8 ref, 2 append.

Descriptors: *Public health, *Waste water treatment, *Commercial shellfish, Sewage treatment, Mollusks, Lagoons, Coliforms, Water quality control, Water pollution control, Canada.
Identifiers: *British Columbia.

Environment Canada is responsible for the sanitary control of the Shellfish Fisheries in British Columbia. Their duties include assessing and classifying the growing water quality of shellfish waters. The bacteriological critieria for an approved shellfish growing water is that the coliform median MPN does not exceed 70/100 ml and not more than 10% of the samples ordinarily exceed a MPN of 230/100 ml for a 5 tube, 3 decimal dilution test in those portions of the area most probably exposed to fecal contamination during the most unfavorable hydrographic and pollution conditions. The percent reduction of coliform bacteria expected from various types of treatment processes is discussed. The highest reduction is expected from stabilization ponds. The operational reliability of treatment plants and sewage collection systems is the most important factor in the protection of shellfish growing waters. Suggested methods for the protection of growing waters include: more effective methods of disinfection; zero discharge to shellfish waters of domestic wastes; utilization of seasonal holding lagoon systems during the harvesting season; and, institution of the concept of positioning sewage treatment plants and outfalls in accordance with plans developed by agencies responsible for administration of public health, installation of treatment systems, land use, and protection of renewable resources. W75-12352

**TOXICITY OF AQUATIC ORGANISMS CAUSED BY CHLORINATION,**
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia). Environmental Conservation Div.
J. A. Servizi.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 171-182. 1 tab, 24 ref.

Descriptors: *Public health, *Waste water treatment, *Chlorination, *Fish, *Toxicity, *Aquatic animals, Sewage treatment, Pathogenic bacteria, Water pollution effects.

Field and laboratory studies have been performed which have demonstrated the toxicity of chlorinated municipal sewage to fish and other aquatic organisms. It has been proposed that the total residual chlorine should not exceed 0.002 mg/liter in areas receiving chlorinated wastes continuously. In areas where disinfection is required to protect public health, alternative methods of disinfection should be used, such as chlorination-dechlorination and ozonation. Chlorination-dechlorination has been shown to be beneficial in protecting both public health and aquatic life. Dechlorination can be impounding freshly chlorinated sewage in lagoons. Although lagooning results in secondary regrowth of coliforms, it is hygienically acceptable since there is presumably no regrowth of pathogenic bacteria. In the absence of chlorination, primary sewage effluents were found to be toxic to fish, while effluents from secondary treatment were essentially nontoxic. Acute toxicity or sublethal toxic conditions for fish are present when chlorine residuals exceed 0.02 mg/liter. Chlorinated municipal sewage may have a combined available chlorine residual from 0.1 mg/liter to 3-4 mg/liter. Therefore, the major step in obtaining a nonlethal treated municipal sewage is limitation of chlorine residual to less than 0.02 mg/liter. Current technology and principles make it possible to discharge a suitable treated waste water which is nontoxic to aquatic organisms and which will not cause public health problems. **COMPUTER CONTROLLED WASTEWATER RECLAMATION PLANT,**
Central Contra Costa Sanitary District, Walnut Creek, Calif.
G. A. Horstkotte, Jr., and D. L. Eisenhauer.
Public Works, Vol 105, No 6, p 63-66, June, 1974. 2 fig, 1 tab.

Descriptors: *Water reuse, *Waste water treatment, *Reclaimed water, *Digital computers, Industries, Flocculation, Quality control, Water treatment, Nitrification, Lime, Water supply, Automatic control, Electronic equipment, *California.

The world's first fully computer controlled wastewater reclamation facility is being constructed in the San Francisco Bay area. Central Contra Costa Sanitary District with a 735 square mile service area has limited future reserves of fresh water in an area with potential for heavy industry expansion. A $48 million 30 mgd wastewater reclamation plant with ultimate design capacity of 120 mgd will recycle domestic sewage as a source for industrial process and cooling water. The plant design was adopted after a detailed 2-year study utilizing a full-scale pilot plant. Most of the district's wastewater influent is normal domestic sewage since industries are required to pretreat their wastes. The reclamation is an expansion of the existing primary treatment plant. Lime clarification added to the primary treatment, biological nitrification-denitrification, and a 2-stage sludge conditioning process that includes lime recovery make this an advanced treatment system capable of meeting the rigid requirements of industrial water users. Exacting standards are maintained by a direct digital control dual computer system. One computer monitors plant data and uses this information to control all treatment processes. The second computer handles off-line functions such as maintenance scheduling and cost analysis, and serves as a stand-by control computer. The operator can override computer control if necessary. Two color graphic cathode ray tube (CRT) display units with keyboards and lightpens allow fast information retrieval and color coded display of process com-

ponents. The system is designed for maximum flexibility. (HerrgNorth Carolina)

**RECYCLING ALLOWS ZERO WASTEWATER DISCHARGE,**
Black, Crow, and Eidsness, Inc., Clearwater, Fla.
L. A. Dove.
Civil Engineering-ASCE, Vol 45, No 2, p 48-51, Feb, 1975. 4 fig, 2 tab.

Descriptors: *Recycling, *Water reuse, *Impaired water use, *Injection wells, *Waste water treatment, Irrigation water, Salvage value, Water conservation, Drawdown, Experimental farms, Viruses, Waste disposal wells, Land spreading, *Florida.
Identifiers: *St. Petersburg(Fla).

A carefully monitored wastewater recycling system in St. Petersburg, Florida, is committed to total recycling of wastewater with zero discharge to surrounding bays. This will reduce the damaging drawdown on the Floridan Aquifer, comply with the 1972 Wilson-Grizzle Act requiring advanced wastewater treatment or its equivalent for all facilities in the Tampa Bay Region, and make use of the nutrients in treated wastewater and sludge. The primary reuse will be in lawn sprinkling, which now uses 15% to 40% of the public water supply. All virus will be removed by holding the effluent to 0.5 JTU (Jackson Turbidity Units) followed by breakpoint chlorination of 0.5 ppm for at least 60 minutes, a process approved by the administrator of the State Epidermiology Research Center in Tampa. A deepwell injection system is also being prepared as a backup for the recycling system for periods when treated wastewater supply exceeds demand or when quality standards are not met. The injection zone has high transmissivity and already contains water similar in quality to seawater. Disposal of digested sludge from the 4 treatment plants will be by controlled truck spraying on the city-owned 150-acre sod farm and nursery. Leachate will be collected by drain tiles, treated, and used for spray irrigation. (Herr-North Carolina)

**EFFECTIVE USE OF HIGH WATER TABLE AREAS FOR SANITARY LANDFILL. VOLUME I,**
VTN, Inc., Orlando, Fla.
R. A. Beluche, G. I. Bergstrom, N. W. Hall, and W. McLellon.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-236 462, $5.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency SW-57d.1, 1973. 143 p, 40 fig, 10 tab, 45 ref.

Descriptors: *Garbage dumps, *Water table, *Feasibility studies, *Landfills, *Florida, Evaluation, Groundwater movement, Observation wells, Sites, Facilities, Waste disposal, Solid wastes, Drainage engineering, Cost analysis, Cost comparisons, Path of pollutants, Surface waters, Surface drainage, Leachate, Earth handling equipment, Access routes, Land use, Operating costs, Operation and maintenance, Environmental effects, Water pollution control, Analytical techniques.
Identifiers: *High water table, Orange County(Fla.), Little Econlockhatchee River(Fla.), Demonstration project.

A demonstration project was designed and operated to determine the feasibility of a solid waste landfill operation in Orange County, Florida, an area containing a high groundwater table. The selection of the 1500-acre site was based on investigation of surface topography and subsurface geology and hydrology which determined the master drainage plan, allowing operation with certain portions dewatered below the level of refuse deposition. Heavy operating equipment was evaluated as to its effectiveness and capabilities under both wet and dry construction and filling operations. The economic assessment includes equipment operating and maintenance, landfill development, capital improvement, and other operating and maintenance costs, and is compared to an incineration facility with equivalent solid waste disposal capacity (280,047 tons). The drainage system proved to be effective in preventing flooding of the total area during intense rainfall and localized flooding was controlled with temporary pumping. Drainage improvements minimized leachates but did not prevent changes in water quality of the upper groundwaters. Procedural refinements and operation techniques were expected to stabilize total costs at approximately $1.50/ton. A landfill in a high groundwater area can only be built successfully if the generated leachate can be contained and controlled to avoid pollution of ground and/or surface waters. (Auen-Wisconsin)

**HYDROGEOLOGICAL ASPECTS OF SOLID WASTE DISPOSAL,**
Wisconsin Univ., Madison. Water Resources Management Program.
A. Zaporozec, and D. A. Stephenson.
Institut fur Sozial-und-Wirtschaftspolitische Ausbildung, Information Bulletin. Vol 7, No 3, p 3-9, 1972. 1 fig.

Descriptors: *Waste disposal, *Landfills, *Sites, Hydrogeology, Solid wastes, Social aspects, Political aspects, Leachates, Aquifers.

The two trends in the approach to the solution of solid waste disposal problems are technological and regional evaluation of hydrogeological conditions. A technological approach assumes that nearly all sites are or can be designed to be suitable for solid waste disposal. The critical factors are then costs analysis, site acquisition, site modification, and carefully controlled operation using high-level engineering techniques. The knowledge of hydrogeological conditions is essential in this approach for determining whether or how to modify the site. The approach is applicable to metropolitan areas where land and transportation costs are high, and where there is a paucity of open land for disposal sites. A regional approach rests on the evaluation of the physical conditions of the region and selection of suitable areas for future disposal sites. The search for suitable sites can be concentrated either on ideal sites where no pollution can occur or on sites suitable for 'controlled pollution.' A regional approach is of the 'advanced-planning' type and will gradually gain greater importance with increasing recognition of the necessity to plan waste disposal on a regional basis. Both technological and regional trends have their advantages and disadvantages, and both are equally important in solid waste disposal. (Auen-Wisconsin)

**GROUND-WATER AND ENGINEERING GEOLOGY IN SITING OF SANITARY LANDFILLS,**
Illinois State Geological Survey, Urbana.
K. Cartwright, and F. B. Sherman.
Transactions, Society of Mining Engineers, AIME, Vol 250, No 1, p 1-6, 1971. 4 fig, 28 ref.

Descriptors: *Landfills, *Sites, *Illinois, *Groundwater, Garbage dumps, Sanitary engineering, Geologic formations, Impervious soils, Water pollution control, Hydrogeology, Geologic mapping.

The salient features of the sanitary landfill concept are summarized and policies are suggested for landfill siting. Illinois regional evaluations of landfill disposal conditions are mapped to show favorable, locally favorable, and unfavorable areas. However, operational practice may preclude the selection of many sites that have less than 10 to 20 ft of unconsolidated material above the bedrock. The map does not show the potential for pollution at individual sites, nor does it take into account the exact physical character of the unconsolidated material or the bedrock formations. Potential landfill sites must be individually investigated before put into operation. The criteria used as a basis for preliminary investigations of hydrogeologic conditions and the potential for groundwater pollution at sanitary landfill sites in Illinois are type of unconsolidated material; thickness of unconsolidated material; type of bedrock; local and potential water sources; and site topography. The engineering approaches that most directly relate to the prevention of water pollution are diversion of surface drainage, interception or diversion of groundwater, collection of leachate for treatment and installation of clay liners. Many strip-mine areas would probably make excellent landfill sites since they are generally in nonurban areas and the coal-producing rocks are not interbedded with important aquifers. (Auen-Wisconsin)

ifiers: *Cleveland Harbor, Rock and slag nd.

environmental impact statement recommends the Diked Disposal Area Site No. 11 be con-ted as proposed. The proposals called for the truction of a rock or rock and slag mound to ide for the disposition of 2,880,000 cubic s of dredge spoil to be removed from the eland harbor during a two-and-a-half to three-a-half year period. The dredging was found to equired to permit the continued maintenance peration of the existing harbor. Adverse ef- considered included the loss of the area oc-ed by the disposal area as an aquatic habitat, dity during construction, and temporary mild ungent odors during use of the structure. r environmental effects considered included evelopment of 60 acres of new land when the l area is filled and the discharge of surplus rs contained in dredged material into harbor rs. The statement noted that precautions will to be taken to lessen any possible effects the project will have on recreational activities. (Hoffman-Florida)

**COMPOSTING AND USE OF COMPOST IN SWEDEN,**
National Swedish Environment Protection Board, Stockholm.
G. Hovsenius.
Journal Water Pollution Control Federation, Vol 47, No 4, p 741-747, April, 1975. 3 tab.

Descriptors: *Sewage sludge, *Sludge treatment, *Sludge disposal, Treatment facilities, Waste water treatment, Testing, Chemical analysis, Cost analysis, Wastes, Groundwater, Water pollution, Heavy metals, Soils, Public health, Bioassay.
Identifiers: *Compositing, *Sweden, Health hazards.

A number of municipal waste water treatment plants for biological oxygen demand (BOD) and phosphorus removal have been constructed over the past ten years as a result of a strong environmental policy in Sweden. This in turn has resulted in a rapid increase in the quantity of waste water sludge. The presence of more than 1,000 treatment plants makes sophisticated sludge handling techniques economically prohibitive. More than 60% of the sludge is disposed of in landfills. Composting would be an alternative to incineration to solve the sludge and garbage problems in small communities. Since composting is relatively untested in northern Europe, a test plant was built at Laxa, Sweden to be operated over a three year period by the National Environmental Protection Board. The plant will perform physical, chemical, and bacteriological analyses of nondigested wastes, digested materials, and cured compost for organics, mercury and other heavy metals, pesticides, coli, salmonella, virus, and parasites. Health hazards for plant personnel will be surveyed. Composting processes and technology in relation to different sludges will be evaluated. A cost analysis of the operation will also be done. Groundwater contamination from compost will be investigated. Both greenhouse and outdoor experiments will be conducted to determine the enrichment of heavy metals in soil and plants. (Dean-FIRL)

**HOW WELL ARE WE HANDLING TOXIC WASTE.**
Surveyor, Vol 146, No 4326, p 19-24, May 2, 1975. 7 fig, 2 tab.

Descriptors: *Waste disposal, *Industrial wastes, *Municipal wastes, Landfills, Investigations, Toxicity, Leachate, *Recycling, Legislation, Oily wastes.
Identifiers: Toxic wastes, Refuse, England, Metal hydroxide sludge, Cyanide heat treatment wastes.

Pitsea, Essex County, England, became a site for industry to deposit waste materials due to the Deposit of Poisonous Waste Act of 1972. Following the Act the amount of waste arriving jumped from 11 million gallons per year to 35 million. A greater regionalization in toxic waste disposal is needed to reduce the increased site management and transportation risks inherent in waste disposal areas that are few in number. In 1973 a research program was begun by the Institute of Geological Sciences, Water Research Center, and Hazardous Materials Service (Harwell) to study the behavior of hazardous wastes in landfill sites. Being investigated are the following: flow pattern in the unsaturated zone of rocks; refuse/hazardous waste/refuse sandwich interactions (Wastes being metal hydroxide sludge, cyanide heat treatment waste, and oily waste); and pulverized refuse. Also, a short course run at six-month intervals is being given. The Warren Spring waste exchange is being operated in an attempt to recycle. There have also been proposed revisions of geological formation classification for the purpose of landfill site and assessment. (Murphy-FIRL)

**RECYCLABLE COAGULANTS LOOK PROMISING FOR DRINKING WATER TREATMENT,.**
Environmental Science and Technology, Vol 7, No 4, p 304-305, April, 1973. 1 fig.

Descriptors: *Potable water, *Water purification, *Coagulation, Dewatering, Recycling, Magnesium carbonate, Magnesium hydroxide, Calcium carbonate, Water softening, *Water treatment.
Identifiers: Lime slurry, Lime-alum treatment.

Drinking water purification methods which utilize alum or iron coagulation leave a sludge which is difficult to dewater due to its gelatinous properties. A new water treatment process uses magnesium carbonate which is recyclable as the coagulant. In this process, lime slurry is added to raw water which either naturally occurring magnesium bicarbonate or magnesium carbonate which as been added. The addition precipitates magnesium hydroxide and calcium carbonate. The magnesium hydroxide acts in a manner similar to the hydrolysis products of iron or aluminum salts and forms a floc which settles impurities out of the water. The treatment system is a combination softening and purification process. The cost of lime-alum treatment, without provision for sludge handling, is $8-10 per million gallons. The cost for magnesium carbonate treatment, with purchased CO2, high calcium lime, and purchased MgCO3, without recycling of lime is about $19 per million gallons. If dolomitic lime could be used and could serve as a magnesium source, the costs would decrease to about $12 /million gallons. (Sandoski-FIRL)

WATER SYSTEM OF NEWPORT, RHODE ISLAND AND ITS RECENT IMPROVEMENTS,
Newport City Engineers Office, R.I.
P. V. Janjigian.
Journal of the New England Water Works Association, Vol 87, No 1, p 41-46, March, 1973. 1 fig.

Descriptors: *Water quality, Water storage, Reservoirs, Storage tanks, Population, Surface water, Groundwater, *Rhode Island, Water supply, Water treatment.
Identifiers: *Newport(RI), Biological contamination.

The City of Newport, Rhode Island provides water service within the City limits and to areas in the Towns of Middletown and Portsmouth. Since 1956 there has been a substantial increase in water consumption and in 1963 the City was urged to take measures to safeguard water quality from biological contamination resulting from lack of cover over treated water storage reservoirs. Improvements since 1965 include: a new 3-mg welded steel storage tank to replace the open storage reservoir, a welded storage tank with 1.5 mg capacity near the Town lines where water consumption has increased rapidly, two intake and pumping stations, expansion of an existing treatment plant from 4 to 8 mgd average, and the rehabilitation, replacement, or installation of approximately 18 miles of mains. With the completion of construction three service areas now supply this region; yet, with unanticiapated population growth the available surface water and usable groundwater supplies are rapidly being depleted. APPARATUS FOR CLEANING LOOSE FILTERING MATERIAL IN SLOW WATER FILLED WATER SUPPLY FILTERS,
B. F. Volokh.
United States Patent 3,732,983. Issued May 15, 1973. Official Gazette of the United States Patent Office, Vol 910, No 3, p 831-2, May 15, 1973.

Descriptors: *Filters, Cleaning, *Patents, *Water treatment, Potable water, Equipment, Filtration.
Identifiers: *Filtering material.

An apparatus for cleaning loose filtering material in slow water-filled water supply filters, comprises a washing chamber equipped with means for its movement relative to the surface of the loose filtering material being cleaned. Mounted inside the washing chamber are washing tubes to feed clean water into the layer of filtering material to be washed. The washing chamber connects with a suction pipe which passes the dirty water. The chamber is provided with means for regulating its pressure upon the filtering material controlling its degree of byouancy. (Sandoski-FIRL)

THE BACTERIAL QUALITY OF BOTTLED WATER,
Environmental Protection Agency, Cincinnati, Ohio. Water Supply Research Lab.
E. E. Geldreich, H. D. Nash, D. J. Reasoner, and R. H. Taylor
News of Environmental Research in Cincinnati, May 23, 1975. 4 p, 1 fig, 4 tab, 6 ref.

Descriptors: *Bacteria, *Potable water, Pseudomonas, Coliforms, Enteric bacteria, Water quality, Standards, Public Health, Quality control, Sampling.
Identifiers: *Bottled water.

Ten per cent of freshly bottled water samples had plate counts above 500 bacteria/ml, 5% contained coliform bacteria, one fecal coliform bacteria, and another Pseudomonas aeruginosa. Forty-two per cent of samples of uncertain age contained above 500 bacteria/ml, 3 had total coliform counts above USPHS Drinking Water Standards, and 1 contained Pseudomonas aeruginosa. Plate counts varied between and within brands, and increased in 75% of samples stored 30 days. Bacterial population changes occurred in samples stored at room temperature for 63 days. Bacterial growth was reduced when water was refrigerated; peak bacterial density occurred after 26 days refrigeration and 11 days at room temperature. Bottled drinking water should be analyzed as frequently as required by USPHS standards and repeated when necessary. When bottled, water should contain less than 1 coliform/100 ml and have plate counts less than 500 bacteria/ml. Retailed water should have less than one coliform 100 ml and plate counts less than 1000 bacteria/ml. Plate count limits should be established. Consumers should be advised to refrigerate bottled water and labels should indicate bottling dates and numbers. (Buchanan-Davidson-Wisconsin).

THE ASSESSMENT OF WATER QUALITY,
Anacapa Sciences, Inc., Santa Barbara, Calif.
D. H. Harris.
Human Factors, Vol 17, No 2, p 139-148, April 1975. 8 fig, 1 tab, 10 ref. OWRT C-3064(No 3680)(2).

Descriptors: *Water quality, *Assessment, *Color, *Odor, *Turbidity, Measurement, Management, Treatment facilities, Variability, Data collections, California, Domestic water, Standards, Water sampling, Potable water, Water supply, *Attitudes, Social values.
Identifiers: *Public acceptance, Ratings.

Turbidity, color and odor have the greatest influence on public acceptance and day-to-day control of water quality. The assessment of water quality is likely to grow in importance as the availability of high-quality raw water becomes more limited. Existing guidelines for controlling water quality in terms of public acceptability are inadequate. Reported is a study in which the objectives were: (1) to determine the methods employed by water treatment facilities to measure turbidity, color, and odor in water; (2) to estimate the variability of measures obtained routinely by the most commonly employed methods; and (3) to relate combinations of measured turbidity, color, and odor values to public acceptability of drinking water. The main end-products of the study were a set of cumulative distributions of water quality measurements and a family of water quality acceptance curves for combinations of turbidity, color, and odor values throughout the full range of public acceptability. GENERAL ASPECTS OF WATER SUPPLY AND TREATMENT IN ONTARIO,
MacLaren (James F.) Ltd., Willowdale (Ontario).
T. W. Lumsden, and W. L. C. Knowles.
Canadian Journal of Civil Engineering, Vol. 2, No. 2, p 154-161, June, 1975. 2 fig, 3 tab, 8 ref.

Descriptors: *Reviews, *Water treatment, *Water supply, Great Lakes, Turbidity, Treatment facilities, Potable water, Rivers, Groundwater, Aeration, Pre-treatment, Urbanization, Canada, *Water sources.
Identifiers: *Ontario.

Water supply sources in Ontario, Canada, are described. Within the province, water sources to be treated include the Great Lakes, southern Ontario rivers and groundwater, and northern rivers and lakes. Each area has its own set of problems of acquisition and treatment of water. Differences include hardness, turbidity, color, chemical composition, and biological and bacteriological content. The effects of industrial expansion and urbanization are also discussed. Current trends in improvement of Great Lakes treatment facilities include pre-treatment with polymers, improving mixing and flocculation, adapting filters to high-rate service, and increasing hydraulic capacity of associated piping. River sources of potable water, particularly in southern Ontario, must be treated for turbidity, chlorides, hardness, dissolved solids, and for removal of algae and phenolic substances. Intensive treatment involves prechlorination; screening; superchlorination and dechlorination with ammonia and sulfur dioxide; taste and odor control with activated carbon; aeration; coagulation with alum and activated silica; pH control with calcium carbonate; sedimentation; filtration; postchlorination; postammoniation; and fluoridation. Groundwater obtained from aquifers in both northern and southern Ontario must be treated to remove entrained gases, which cause odor, taste, and corrosion problems. Aeration followed by filtration removes iron and manganese and the unwanted gases, while most well supplies are chlorinated. (Kramer-FIRL)

OPERATIONAL VARIABLES AND LIMITATIONS OF DIRECT FILTRATION,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
W. R. Hutchison.
Research Report No. W54, January, 1975. 118 p, 14 fig, 35 tab, 42 ref, 29 append.

Descriptors: *Water treatment, *Filtration, *Suspended solids, Coals, Efficiencies, Separation techniques, Water quality control, Diatoms, Polymers, Polyelectrolytes, Algae, Pilot plants.
Identifiers: *Direct filtration, Alum, Ferric chloride, Filter breakthrough.

Some of the operating limitations of water treatment by direct filtration during periods of raw water turbidity greater than 20 Ftu or diatom levels of 500 Asu/ml are described and the results of a pilot plant study on the effect of various operating variables are presented. The lengths of filter runs vary inversely with the suspended solids loadings excluding algae. Alum was the dominant factor in determining the overall filter run length. Alum and ferric chloride produced similar quality effluent. Cationic polyelectrolytes lowered the alum requirements. If diatoms were absent, the best effective size of coal, with respect to effluent quali-

ength of filter runs, and floc distribution
the filter bed, was approximately 1.05 mm.
al media filters, effluent turbidity was not a
ion of the effective size of the coal within the
range from 0.9 to 1.55 mm. The optimum
oss distribution for maximizing filter runs
bout 75% for coal and 25% for sand. Diatom
as low as 200 Asu/ml changed the headloss
bution within the filter bed. Filter coal with
fective size of 1.5 mm operated with diatom
averaging 2500 Asu/ml produced filter runs
r than 12 hours at 4 Igpm/sq ft. The chance of
breakthrough was increased by increasing
ffective size of the coal or sand, the alum
e, the filtration rate, the flocculation
nt above 20/sec and the flocculation time to
than 10 minutes, or by decreasing the depth
dia. Polymers prevented breakthrough on all
sizes up to 1.55 mm under all conditions
. An increase in the pH resulted in a deteri-
n of the final effluent quality. (Orr-FIRL)

r purification, *Flocculation, Monitoring,
mation, Control system, Alabama, Water
y standards, Waste water treatment.
ifiers: Jackson(Ala).

The city of Jackson, Alabama, has designed a new water purification plant with a capacity of two mgd. The municipal water supply source is the Tombigbee River, along which industrial expansion is expected. The new industries--chemical and paper mills--will be expected to meet strict Alabama water pollution standards. The water treatment plant will have several unique features. Flocculators were designed for flexibility by building four units with vertical paddles, rather than the traditional two horizontal units. The LIGHTNIN model 34Q2 mixers with flocculating turbines also have variable speed control. River clarity changes often, and this variability is needed to keep solid particles properly suspended. Conical diffusers control the flocculating water as it enters the settling basin. Mud-laden water is trapped by these diffusers where the water loses velocity and dumps most of the mud at one end of the tank. Water conditions, from raw inflow to finished water, are automatically monitored from remote control panel.

Descriptors: *Treatment facilities, *Water treatment, *Computers, *Filtration, *Precipitation(Chemical), Urbanization, Water supply, Groundwater, Monitoring, Instrumentation.
Identifiers: Chemical treatment, *Japan.

The Showa Water Purification Plant, on the River Edo, Japan, is described. A facility with a water supply capacity of 350,000 cu m/day has been built in the Saitama Prefecture in order to meet an increase in water demand associated with urban growth and a decrease in goundwater resources from pumping. The treatment process involves precipitation, filtration, and sterilization. Computer control is implemented, for chemical injection and control of water flow. If the computer system is inoperable, a backup system of automatic analog control may be used. The facility has been in satisfactory operation for one year since its construction. (Kramer-FIRL)

**PROCESS FOR RAW WATER CLARIFICATION,**
American Cyanamid, Stamford Conn. (assignee).
H. P. Panzer, and K. W. Dixon.
U.S. Patent No. 3,894,944, 6 p, 1 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 936, No 3, p 1007, July 15, 1975.

Descriptors: *Patents, *Water purification, *Water treatment, *Flocculation, *Water quality control, Suspended solids, Chemical reactions, Separation techniques.

This invention relates to an improved process for clarifying raw water or natural water derived from rain, snow, rivers, ponds, reservoirs, etc. The water may have suspended particles which affect the clarity of the water and render it undesirable for its intended use. The raw water is clarified when it is treated with an effective amount of a polyquaternary flocculant obtained from the reaction of an epoxy compound and a secondary amine until a solution viscosity of at least 100 centistokes at 25 deg. C. is obtained as a 37% solids solution, by weight, based on the cationic portion of the polyquaternary compounds. (Sinha-OEIS)

**WATER TREATMENT DEVICE,**
Water Technology Service, Inc., Cleveland, Ohio. (assignee).
H. S. Aber, D. D. Riggs, and J. Lamantia.
US Patent No 3,899,410, 5 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 937, No 2, p 628, August 12, 1975.

Descriptors: *Patents, *Water treatment, *Water softening, *Demineralization, Scaling, Screens, Cleaning, Electric currents, Electrical conductance.

An electrical liquid treatment apparatus is described which is used in eliminating the hardness effects of water. A cleaning device used with the apparatus removes undesirable mineral deposits from surfaces. Another object of the invention is to treat liquid to prevent scale and other mineral formation in liquid systems. The apparatus includes an enlarged fitting adapted for coupling in a flow line and a insultated screen supported in the fitting. An electric potential is applied between the screen and the fitting. A cleaning device having sharp edges is positioned in the fitting to clean mineral and other devices deposits from the screen. (Sinha-OEIS)

**IRON AND MANGANESE REMOVAL WITH OZONE. PART II**
R. R. Furgason, and R. O. Day.
Water and Sewage Works, Vol 122, No 7, p 61-63, July, 1975. 5 tab, 8 ref.

Descriptors: *Ozone, *Municipal water, *Iron, *Manganese, Oxidation, Pilot plants, Water treatment, Potable water, Capital costs, Operating costs, Public Health, Idaho.
Identifiers: Public Health Drinking Water Standards, Moscow (Idaho).

Iron and manganese removal using ozone oxidation was demonstrated in a pilot study at the Moscow, Idaho, municipal water system. Iron and manganese were effectively oxidized to an insoluble form which could be filtered from water. Raw water with iron and manganese concentrations of 9.5 and 1.2 mg/liter, respectively, was treated with ozone at a dosage of 8.8 mg/liter. This removed all the Fe and Mn to below Public Health Drinking Water Standards. At an ozone dosage of 6.3 mg/liter, the iron was removed, but a 0.1 mg/liter residue of Mn remained. Complete oxidation of

both minerals involved a reaction time of 30 seconds. When compared to other methods, the capital investment costs of the ozone treatment were high, but the operating cost of $0.500/1000 gallons was competitively low. (Kramer-FIRL)

**ANALYSIS OF REVERSE OSMOSIS FACILITIES, GREENFIELD, IOWA,**
B. W. Knowles.
National Waste Supply Improvement Association Journal, Vol 2, No 2, p 29-34, July, 1975. 2 fig, 2 tab.

Descriptors: *Reverse osmosis, *Water treatment, Water supply, Wells, Pumps, Instrumentation, Water quality control, Maintenance, Waste discharge, Iowa, Waste water treatment.

The DuPont Permasep B-9 system for reverse osmosis treatment has been implemented in Greenfield, Iowa, since 1971 as an auxillary water supply from previously useless raw well water. This is the first reverse osmosis facility to have been built for municipal use. The system consists of three separately controlled units, each containing 24 parallel mounted permeators, a high pressure multistage centrifugal pump, and necessary instrumentation, hardware, and piping. Water quality for the three years of operation has been significantly better than the recommended 500 ppm TDS. Maintenance involves cleaning iron precipitate built up on the membranes, if and when pressure drop exceeds 50 psi. Brine disposal is achieved by discharge to a storm sewer. Operational costs are approximately $30.30 per 1000 gallons, excluding amortization. (Kramer-FIRL)

**CLEARWELL QUALITY DOESN'T LAST,**
Sioux Falls Water Dept., S. Dak.
L. J. Hash.
The American City, Vol 90, No 5, p 56-57, May, 1975. 2 fig.

Descriptors: *Distribution systems, *Bacteria, Water, Odor, Taste, Conduits, Iron, Pipes, Corrosion, Chlorination, Aeration, Adsorption, Activated carbon, Nitrogen, Phosphorus, *Water treatment.
Identifiers: Organic carbon, Bacterial growth, Ozonation, Potassium permanganate, Bacterial growth stimulators.

Problems in a water distribution system can be indicated by red water, cloudy water, and taste and odor complaints. These problems may be caused by bacterial action. The accumulation of flocculation of iron can be intensified by bacterial growth and can occasionally be dislodged during periods of high velocities in the mains. An undesirable taste similar to that of stagnant water can also be caused by an accumulation of bacterial growth. Depletion of oxygen or destruction of chlorine residuals can occur when certain species of bacteria are present. Accumulations of bacteria in unlined cast iron pipes can serve to inhibit or accelerate corrosion, depending on the extent and nature of the accumulation. Increases chlorination and lowered pH is an obvious answer to extensive bacterial growth. Organic carbon, nitrogen, and phosphorus are necessary for bacterial growth. Organic carbon appears to be the limiting nutrient in the distribution system. Aeration, ozonation, addition of potassium permanganate, or adsorption on activated carbon could accomplish the removal of a carbon source during treatment. Nitrogen and phosphorus sources should be added to water only after their assessment as potential bacterial growth stimulators. The same care should be taken prior to adding sulfuric acid as a pH control after softening to the finished water. (Dean-FIRL)

**AERATION UPGRADES RESERVOIR,**
Escondido Mutual Water Co., Calif.
R. S. Harper.
Water and Sewage Works, Vol 122, No 6, p 40-41, June, 1975.

Descriptors: *Reservoirs, *Aeration, *Dissolved oxygen, Hypolimnion, Reservoir operation, Reservoir evaporation, Turnovers, Upwelling, Odor, Taste, Water treatment, Mixing, Hydrogen sulfide, California.
Identifiers: *Lake Wohlford reservoir(Calif).

A compressor-operated aeration system has been decreasing the hydrogen sulfide concentration and increasing the dissolved oxygen content in the Lake Wohlford reservoir in California since the mid-1960s. The installation consists of a Schramm Model 210 Compressor connected by a 2 in galvanized pipe to a 1 1/2 PVC pipe that reaches 40 ft deep into the lake at the hypolimnion. This pipe ends with 20 ft sections, each perforated with 30 holes to release the compressed air. The aeration system is designed to operate at 22 psig, with a volume of 210 cfm. Air leaving the openings forms into bubbles which rise to the surface. Oxygen is dissolved at the interface of each air bubble and its surrounding water. The mass of rising bubbles creates a boiling effect on the surface. Water, no longer supported by the jet, flows outward 360 degrees around the boil pattern. The dissolved oxygen picked up at the water/atmosphere interface is about equal to the amount assimilated from the compressed air bubbles. The major factors which determine the overall mixing time are the expanse of the compressed air column and the duration of the compressor operation. The boil column at Lake Wohlford is about 0.7 acres after a 30 hr compressor run. The aeration system has reduced the chlorine dosage necessary to treat the water for drinking, has reduced evaporation resulting in a saving of 35 acre feet of water, and has increased the fish population due to the improved dissolved oxygen content. **PROCEEDINGS OF THE ANNUAL CONFERENCE OF THE BRITISH COLUMBIA WATER AND WASTE ASSOCIATION.**
April 9-11, 1974. Conference held at Vancouver, B. C. 272 p.

Descriptors: *Waste water treatment, *Potable water, *Water supply, Water resources, Groundwater, Sewage, Irrigation, Disinfection, Pumps, Chlorination, Standards, Water quality, *Canada, Oil spills.
Identifiers: Horizontal groundwater collectors.

The 1974 annual conference of the British Columbia Water and Waste Association was held in Vancouver, British Columbia, during April 1974. Papers were delivered on the topics of: water resources; water rates; pump selection; water supply; role and responsibilities of the Environmental Protection Service (Canada); horizontal groundwater collectors; and oil spill technology. Actual treatment methods discussed included disinfection, alternatives to disinfection, package treatment plants, and spray irrigation of sewage. A panel discussion was held on the Canadian Drinking Water Standards and objectives with respect to the programs carried out by the provinces to insure that they are providing suitable drinking water to their residents. **THE FLOATING COVER: BEST WAY TO COVER A FINISHED-WATER RESERVOIR,**
G. Dellaire.
Civil Engineering, ASCE, Vol 45, No 6, p 75-79, June, 1975. 4 fig.

Descriptors: *Reservoir storage, *Storage tanks, *Deterioration, *Air-water interfaces, Potable water, Municipal water, Water quality standards, Pollution, Reservoir operation, Water supply, Chlorination, Comparative costs.
Identifiers: *Reservoir covers, Floating reservoir covers.

Federal and state governments are increasing pressure on municipalities to protect the quality of treated water by covering their distribution reservoirs. Often contamination from bird and animal wastes, dust, airborne hydrocarbons, and odor causing algae is introduced into treated water in uncovered finished-water reservoirs. Many states require covers on all new reservoirs. Covering older reservoirs can be expensive, but costs are offset by a decreased need for treatment chem

d for reservoir cleaning and maintenance. columnrsupported concrete, wood, or steel nd aluminum geodesic domes are expensive struct and leave on air space above the Unless space is well ventilated escaping e gas may attack steel and concrete covers; vapor built up in the space can rot wooden Occasionally these heavy structures have escructive to older reservoirs not designed port the weight. A 45-mil floating plastic s less costly to purchase, install, and maind though this type of cover is relatively d untried, studies suggest that they should m 25 to 40 years. Since no air space exists the water, algae cannot grow there and e gas does not escape from the finished which allows a smaller chlorine dosage. The drawback of floating covers is the reservoir be drained, inspected and repaired since er rides down with the water and covers the . Scuba divers to do occasional inspecting, g and patching while water remains in ir are an expensive alternative. (Herr-Carolina)

## Water Quality Control

**MINE DRAINAGE IN CANE CREEK , NEAR OAKMAN, WALKER COUNTY, AMA,**
gical Survey of Alabama, University.
Hyde.
gical Survey of Alabama, Circular 64, 1970, fig, 1 tab, 3 ref.

ptors: *Acid mine water, *Mine acids, c water, *Acid streams, Water pollution, drainage, Mine water, Waste water, Pollu-Coal, Strip mine wastes, Strip mines, Spoil *Alabama, Water pollution control.
iers: *Iron sulfides, *Sulfuric acid, Cane Ala), Walker County(Ala), Oakman(Ala).

drainage results from the passage of water nd through strata or spoil piles that are high fide minerals. The oxidation of sulfide ls in the presence of water forms sulfuric nd releases its products to nearby streams. on sulfide minerals are generally associated he rocks above and below the coal seam. Creek, throughout its length of 14 miles, ed from a neutral stream to a very acidic , to a less acidic stream, and then back to a l stream (pH ranged 8.0 to 3.0). Close cor-n between low stream stage and high pH of ter was found. Acidic water shortens the life inary metals and concrete used in construc-he water is not suitable for municipal or in-l use without extensive treatment, and is sfactory for recreational use. Tests were o determine the resistance of materials used d culverts to acidic waters. Control of acid ge is complex and often economically im-cal. No single method has been entirely relia-: several measures are presented.

**MANAGEMENT OF WATER IN HERN IRELAND, WITH PARTICULAR RENCE TO WATER POLLUTION,**
nce, and M. G. W. Bell.
Pollution Control, Vol 72, No 1, p 10-19, fig, 4 tab, 11 ref.

ptors: *Water quality, *Water supply, pollution, Effluents, Surface waters, , Sampling, Public health, Data collections, tant identification.
iers: *Ireland, Coastal waters.

Water quality data relating to the surface and coastal waters of Northern Ireland are ar present very limited. However, the Department of Industrial and Forensic Science (DIFS), Ministry of Commerce, has since 1949 undertaken numerous water quality examinations over much of the province in relation to specific incidents or effluent disposal problems. The Fisheries Conservancy Board and Foyle Fisheries Commission also have developed considerable knowledge of pollution problems in Northern Ireland, as have the public health authorities. In order to obtain the necessary data, water quality sampling stations are being established throughout the country, which has been divided into seven hydrometric areas. The stations are situated on tributaries and at the mouths of major rivers and in relation to principal discharges or areas of special interest for amenity or other purposes. Each station is calibrated to ensure that any sample from it is representative of the river water quality in the emmediate vicinity. (Sandoski-FIRL)

**COAL MINE DRAINAGE POLLUTION--1973,**
Pennsylvania State Univ., University Park. Mine Drainage Research Section.
Harold L. Lovell.
Earth and Mineral Sciences, Vol. 42, No. 52, p. 54-55, 1973. 28 ref.

Descriptors: *Mine drainage, *Coal mines, *Water pollution control, *Water pollution treatment, Legislation, Research and development, Methodology, Acid mine water, *Pennsylvania.
Identifiers: Coal mine drainage.

The steps taken and the progress made through legislation, research, and action programs toward cleaning up streams polluted by mine drainage are summarized. Pennsylvania, other coal-producing states, and Congress have passed legislation which curtails stream debasement by mining. Quality specifications have been set for water discharge and acceptable mining procedures. Pennsylvania has instigated the design and operation of a mobile treatment pilot plant and construction of a full-scale Experimental Mine Drainage Treatment Facility, which utilized chemical neutralization procedures; distillation, ion exchange, reverse osmosis have also been studied in prototype installations. Corrective and preventive measures helpful in current strip mining operations include temporary water treatment using soda ash, drainage control, slope control, shortened land-disturbance intervals, and rapid revegation. Better coal refuse disposal now minimizes both water and air pollution. Several hundred facilities now treat drainage from active mines. The cost and process advantages of limestone when combined with biochemical iron oxidation have been demonstrated. The areas of current concern are control of drainage formation, correction of areas blighted by abandoned mines, improved treatment reliability and control with reduced labor requirements. The reverse osmosis process appears to be the most feasible for obtaining the higher purity levels but remains to be proven by time. (Auen-Wisconsin)

**SODIUM HYDROXIDE TREATMENT OF ACID MINE DRAINAGE,**
Environmental Protection Agency, Rivesville, W. Va. Croion Mine Drainage Control Field Site.
J. L. Kennedy.
EPA National Environmental Research Center, Cincinnati, Ohio. Office of Research and Monitoring, Report February 1973. 8 p, 1 fig, 4 tab, 3 ref.

Descriptors: *Mine drainage, *Alkalis(Bases), *Waste water treatment, *Sodium compounds, *West Virginia, Application methods, Water purification, Flocculation, Water quality, Sludge, Slurries, Comparative costs.
Identifiers: *Sodium hydroxide.

A sodium hydroxide solution was used to lower acidity and remove some of the chemicals in small mine-drainage flows in remote locations and its efficiency evaluated. The feeding device used was easily moved, required no electricity, needed very little maintenance, and was relatively simple to operate. The sodium hydroxide system maintained effluent pH between 6.6 and 7.6 and removed acid, iron, and aluminum regardless of the wide variance of water flow (from 13 gpm to 108 gpm). The cost for sodium hydroxide was considerably higher, however, than treatment by lime, limestone, or soda ash of similar water. But costs may be economically comparable as power and large storage hoppers are needed to reliably feed lime, limestone and soda ash, and these materials are difficult to keep in slurry. Baffles or similar arrangements are needed to ensure good mixing of the sodium hydroxide and the acid mine drainage after the effluent leaves the measuring flume. A settling pond to collect solids is recommended in all cases where the raw acid mine drainage contains more than 20 to 30 ppm of acidity because of the iron and aluminum precipates that would be formed. (Auen-Wisconsin)

**STRONG IMPACT OF TEXTILES BY U.S. WATER CONTROL ACT,**
L. C. Woodall, and T. A. Alspaugh.
Modern Textiles, Vol 54, No 2, p 12-13, 20-21, 1973.

Descriptors: *Pollution abatement, *Water pollution control, *Textiles, Industries, Economic impact, Regulation, Standards, Waste treatment, Costs, Federal Water Pollution Control Act, Optimization, Legislation, Air pollution, Waste disposal, Environment, Incineration.
Identifiers: *Textile industry, Zero discharges, Noise limitation.

The chairmen of the panel on Textile Manufacturers at the First International Pollution Engineering Conference held at Cleveland on December 4-7, 1972 summarize the highlights of the contributing papers. The provisions of the Federal Water Pollution Control Act Amendments of 1972 were considered too stringent in their objective of zero discharges as based on a cost/benefit analysis; specifically the cost for eliminating the remaining pollutants above 85-90% may be as high as the first 85-90%. It was emphasized that the costs of resources--energy, steel, coal, aluminum, etc.,--to remove 95-99% pollutants would be outbalanced by the benefits of total pollution control. The costs of waste treatment by municipal or joint municipal-industry operations, plus plant pretreatment costs, seem to favor total treatment by each individual plant. Other subjects discussed were noise control, environmental control programs, air pollution from drying and curing ranges, discharge of toxic substances, employee health and safety and solid waste disposal; and the problems of new plant designs to meet acceptable environmental standards, which deplorably are not static. Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
G. M. Wood.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2 September 18-19, 1974, Toronto, Ontario, Canada, p 110-119, (1974) 2 tab.

Descriptors: *Regulation, *Treatment facilities, Sites, Management, Organic wastes, Monitoring, Rates of application, Heavy metals, Nutrients, Damages, Compensation, Land, Soil analysis, Canada.
Identifiers: Environmental Protection Act(Canada), Guidelines, Crop analysis, Spreading equipment, Haulers.

Regulation 824 of the Environmental Protection Act, in Canada, has been amended to designate and define organic waste processing and establish guidelines for construction and operation of organic waste sites. Haulers will need a Certificate of Approval for hauling and spreading equipment and for the number of sites needed for each sewage treatment plant. Guidelines have been set up for the sites covering location, land characteristics, management, and application rates of processed organic waste. The sites must be monitored for buildup of heavy metals and nutrients by the sampling of soils and crops. It is hoped that these guidelines with built-in safety factors will prevent permanent damage or degradation by the use of sludge on farmland. If damage does occur, due to hauler negligence or to plant errors in processing organic waste quality, the legal responsibility and compensation to the individual will need to be determined. **FLOATING AQUATIC PLANTS REMOVE CHEMICALS FROM POLLUTED WATERS.**
Water and Pollution Control, Vol 113, No 6, p 23, 25, June, 1975. 2 fig.

Descriptors: *Aquatic plants, *Pollution abatement, *Metals, Waste water treatment, Nutrient removal, Absorption, Fermentation, Sewage, *Water hyacinths, Costs, Phenols, Insecticides, Water pollution control.
Identifiers: Chemical pollutants, Toxic metals.

NASA's National Space Technology Laboratories (NSTL) in Bay St. Louis, Mississippi has been experimenting with water hyacinths to determine the plant's ability to absorb and concentrate toxic metals, and metabolize other chemical pollutants - phenols, creosols, insecticides, nitrates, and phosphates. In early 1975 large quantities of water hyacinths were planted in a portion of the 60-acre lagoon that serves as the city's total sewage disposal outlet. The planting begins a complex process that results in the total recycling of enormous quantities of water hyacinths. One month after initial stocking, plant harvesting begins; by this time the plants will have reproduced enough to appreciably reduce pollution levels. The harvested crop is subjected to procedures to determine impurity assimilation. Two methods under study by NSTL involve continual processing of the water hyacinths. Anaerobic fermentation converts shredded water hyacinths into bio-gas, similar to natural gas. The potential yield is expected to be 28,500 cubic meters of gas per acre of plants. Pyrolytic decomposition produces a mixed hydrocarbon fuel similar to bio-gas. Plants grown in domestic sewage effluent (low in toxic metal content) will be evaluated as an animal food source. Residues from these processes will yie high grade fertilizer. The advantages of the i tegrated aquatic plant disposal method are dur bility and low installation and maintenance cost An obvious drawback is that it is limited to tropic and subtropical climate zones. **HIGH SEAS OIL PORT ACT.**
Hearings and Report--Comm. on Merchant Marine and Fisheries, U. S. House of Representatives, 93d Cong, 2d Sess, May 15, 1974. 40 p.

Descriptors: *Legislation, *Offshore platforms, *Foreign trade, *Oil industry, *Environmental effects, Oceans, Coastal structures, Coasts, Marine fisheries, Import, Economics, Ecology, Oil, Oil pollution, Legal aspects, Permits, Regulation, Water law, Administrative agencies, Transportation, Federal Government.
Identifiers: *Congressional hearings, *Licenses, *High Seas Oil Ports Act, Administrative regulations, Coastal waters, Coastal zone management, Environmental policy, Hazardous substances(Pollution).

After consideration of bill H. R. 11951, as amended, the House Committee on Merchant Marine and Fisheries reported favorably and recommended enactment. The purpose of the legislation is to authorize the issuance of licenses to eligible applicants for the construction and operation of high seas oil ports in the offshore coastal waters of the United States, as a means for the unloading and further handling of petroleum and petroleum products for transshipment to the United States. The bill outlines mandatory procedures to minimize adverse impacts on the marine environment, and to protect national, and state, and local interests which would be affected. This legislation seeks to facilitate oil importation in the manner most economically and environmentally desirable. Title I authorizes the Secretary of the Interior to issue licenses for construction of high seas oil ports if the Secretary, after consultation with other appropriate federal agencies and departments, determines that the applicant is, in all respects entitled to a license under the various provisions of the Act. Title II deals with the operation of the ports and places responsibility for oversight of operations in the Secretary of the department in which the Coast Guard is operating, and grants authority to promulgate and enforce reasonable rules and regulations. **1973 IMCO CONFERENCE ON MARINE POLLUTION FROM SHIPS.**
Hearings--Comm. on Commerce, U. S. Senate, 93d Cong, 1st Sess, November 14, 1973. 177 p, 5 append.

Descriptors: *Waste disposal, *Solid wastes, *Leakage, *Treaties, *International law, Water pollution, Water pollution control, Oil spills, Abatement, Sewage, Legislation, Legal aspects, Jurisdiction, Law enforcement, Water resources, Public health, International commissions, International waters, Law of the sea, Oil, Oil pollution, Oily water, Ships.
Identifiers: *Intergovernmental Maritime Consultative Organization, *International Convention for the Prevention of Pollution from Ships, Marine pollution.

A report on the 1973 Intergovernmental Maritime Consultative Organization (IMCO) Conference on Marine Pollution from ships was made before the U. S. Senate Commerce Committee. Its purpose was to present to the Committee for approval the new International Convention for the Prevention of Pollution from Ships. The treaty is an extension of a resolution by the IMCO Assembly to completely eliminate the willful and intentional pollution of the sea by oil and other noxious substances and to minimize accidental spills. The treaty governs five types of discharge from ships: oil, noxious liquid substances, harmful packaged goods, sewage and garbage. Some of the specific articles adopted include the imposition of more stringent regulations on the discharge of refined oil products; the adoption of segregated ballast requirements; and, the prohibition of oil discharge within 50 miles of land and within designated special areas, i. e., Baltic, Black, Red and Mediterranean Seas. IMCO evaluated and now regulates almost all of the major liquid substances carried in bulk on the oceans. It indicates the relative hazard to marine resources, human health, and amenities. The treaty is not self executing and will require the enactment of domestic legislation. The treaty provides for international enforcement by the individual adopting countries. (Altuve-Florida)

**POLLUTION CONTROL UNDER THE PENNSYLVANIA CLEAN STREAMS LAW,**
A. Charlson.
University of Pittsburgh Law Review, Vol XXXIV, No 1, p 115-129, 1972. 15 p, 51 ref.

Descriptors: *Mine drainage, *Mining, *Mine water, *Mine wastes, *Pennsylvania, *Judicial decisions, Waste water disposal, Industrial wastes, Water treatment, Water quality, Water pollution, Penalties (Legal), Legislation.
Identifiers: *Due process.

The impact of two recent court cases on the Pennsylvania Clean Streams Law is analyzed in this article. The cases involved interpretation of section 315 of that statue which requires operators of mines to treat polluted water which it pumps from its mines. Mine operators contended that they were only required to treat polluted water discharges from active mines. One case involved water which was pumped from an adjacent mine for the purpose of protecting an active mine. The other case involved water from an inactive mine which commingled with other water and was discharged together with water originating in an active mine. In both cases the Commonwealth Court held that mine operators were not required to treat water which did not originate in an active mine. The article analyzes the Court's interpretation of various statutory language, such as mine, mine drainage, and source. The article also explored the problems of proof and fault and their relation to the constitutional requirements of due process. (Hoffman-Florida)

**A RIVER RESTORED: OREGON'S WILLAMETTE,**
National Geographic Society, Washington, D. C.
E. A. Starbird.
National Geographic, Vol 141, No 6, p 816-834, June 1972. 12 p, 1 map, 6 photo.

Descriptors: *Oregon, *Industrial wastes, *Pulp wastes, *Pollution abatement, *Fish ladder, *River regulation, Water pollution, Water pollution sources, Water quality, Spawning, Chemical wastes, Pulp and paper industry, Permits, State Government, Regulation, Water pollution effects, Water pollution treatment.
Identifiers: Willamette River (Ore), Permit systems, Spawning grounds.

Oregon's Willamette River was one of the most polluted waterways in the nation less than a decade ago. The river had become clogged with agricultural, industrial, and human wastes. Finally the public took steps to clean up the river, despite claims from the polluters that the cost of corrective steps would be prohibitive. Astate permit system was passed, without the waivers and variances that have underminded similar efforts, setting quality standards for all liquid discharges and requiring frequent testing of outflows. Pulp and papermakers, once the worst polluters, were required to start installing chemical recovery and secondary waste treatment facilities. Because of these and other pollution controls, waste discharges have been reduced by 90 percent. Overall water quality has been raised; water-contact sports are again safe; and the number of game fish has increased dramatically. Because the fish can once again survive in the Willamette, a 3.7 million dollar fish ladder was constructed to help fish climb the face of a cliff to reach spawning grounds. A program has been set up to keep a constant watch for potential violators.

**LITIGATION UNDER THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1974,**
Environmental Law Inst., Washington, D.C.
K. L. Hall.
Environmental Law Reporter, Vol IV, p 50109-50122, 1974. 12 p, 139 ref.

Descriptors: *Federal Water Pollution Act, *Judicial decisions, *Jurisdiction, *Pollution abatement, Water pollution, Water quality act, Water pollution treatment, Water law, Waste water treatment, Legislation.
Identifiers: Federal Water Pollution Control Act Amendments of 1972, *National Environmental Policy Act, Injunctive relief, Navigability tests.

Recent litigation arising under the Federal Water Pollution Act (FWPCA) Amendments of 1972 is classified and analyzed. The FWPCA is said to have had three goals: (1) to furnish financial aid for the planning and construction of waste treatment facilities; (2) to regulate the discharge of pollutants into American waterways; and (3) to encourage planning for waste treatment management. Cases to date have involved only the first two goals, with the bulk of litigation centering on regulation of pollutant discharge. Courts are in agreement that the 1972 Amendments did not repeal prior federal law relating to water pollution control. However, other ambiguities arising under these amendments are not fully resolved. The author includes the controversy over presidential impoundment of appropriated funds among these problems, although she recognizes that the trend in these matters is clearly against the asserted presidential authority. Although most courts have ruled that navigability is no longer a jurisdictional requirement in the federal control of water pollution, that issue is not entirely resolved. The question of the notice requirement for citizen suits is still in doubt, as is the issue of whether the citizen suit provision is the exclusive remedy under the Act. A further problem, and one which arises in a variety of contexts, is the degree of discretion enjoyed by the Administrator under the Act. The author concludes that, from an environmentalist's point of view, the decisions today are quite favorable, although with so many issues unresolved, no final analysis of the court's role is possible. (Gerlach-Florida)

**DRAFT PROPOSAL FOR LEGISLATION TO CONTROL WATER POLLUTION FROM AGRICULTURAL SOURCES,**
R. Piampiano.
Cornell Law Review, Vol 59, p 1097-1125 (1974). 29 p, 161 ref.

Descriptors: *Agricultural runoff, *Agricultural chemicals, *Water pollution, *Water pollution control, *Water pollution effects, Water pollution sources, Agriculture, New York, Pollutant identification, Pollution abatement, Pollutants, Water, Water quality, Water quality control, Toxicity, Nitrogen, Phosphorous, Pesticides, Pesticide toxicity, Plant growth, Soils, Crops, Groundwater, Eutrophication, Wastes, Animal wastes(Wildlife), Fertilizers.
Identifiers: Hazardous substances(Pollution), Non-point sources(Pollution), NEPA, Refuse Act of 1899.

Because a great deal of agricultural water pollution comes from so-called 'non-point' sources which are difficult to identify, quantify, and discern, agricultural pollution is less visible to public scrutiny and concern. However, the volume of agricultural pollution suggests that legislative efforts must enter a new phase of development--increased control of specific sources of agricultural pollution. Of the many substances used in agricultural operations which are potential pollutants, three are of primary concern to water quality management: nitrogen, phosphorus, and toxic chemical pesticide residues. When compounds with high concentrations of nitrogen and phosphorus are applied in proper amounts with proper techniques, the result is beneficial to plant growth and soil development. The chemicals become potential pollutants only when the amount applied exceeds the amount which can be used by plants, crops and the soils, because the excess is then available to leach or run off into surface and ground water, resulting in contamination and eutrophication. It is clear that present methods of pollution control fail to take account of the special difficulties involved in regulating the disposal of animal wastes and the use of fertilizers and pesticides. Greater public and legislative awareness of these special problems is required to arrive at an effective plan and appropriate methods of control. (Gagliardi-Florida)

**WYANDOTTE AND ITS PROGENCY: THE QUEST FOR ENVIRONMENTAL PROTECTION THROUGH THE ORIGINAL JURISDICTION OF THE SUPREME COURT,**
Pepper, Hamilton and Schultz, Philadelphia, Pa.
B. W. Ficken.
Dickenson Law Review, Vol 78, p 429-459 (1974). 31 p, 153 ref.

Descriptors: *Jurisdiction, *Judicial decisions, *Mercury, *Ohio, *Federal-state water rights conflicts, Constitutional law, Governmental interrelations, Interstate, Common law, Federal jurisdiction, State jurisdiction, Water rights, Legal aspects, Water law, Water pollution sources, Water pollution, Environmental effects, Environment.
Identifiers: *Hazardous substances(Pollution), *Injunctive relief, *Mercury pollution, Nuisance(Legal aspects).

In Ohio v. Wyandotte Chemicals Corporation the State of Ohio sought to invoke the original jurisdiction of the United States Supreme Court to enjoin Wyandotte from dumping mercury into streams whose course ultimately reached Lake Erie. Although the Court acknowledged its jurisdiction, it declined to exercise it. This comment analyzes the Court's approach to the exercise of its original jurisdiction in light of Wyandotte and three subsequent cases. Particular consideration is given to clarifying those factors which influence the exercise of original jurisdiction. The comment outlines a course of action and arguments for the environmentally aggrieved state seeking to invoke the original jurisdiction of the Supreme Court. The author concludes that unless the action can be properly characterized as a suit between two or more states, an attempt to invoke the original jurisdiction of the Court will probably be unavailing. (Fernandex-Florida)

**FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972,**
D. N. Stern, and E. M. Mazze.
American Business Law Journal, Vol 12, p 81-86 (1974). 7 p, 22 ref.

Descriptors: *Federal Water Pollution Control Act, *Legislation, *Legal aspects, *Pollution abatement, *Navigable waters, Governmental interrelations, Non-structural alternatives, Administration, Industries, Environmental control, Water pollution control, Research and development, Grants, Monitoring.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Enforcement procedures, *Notice, Monitoring procedures.

Governmental regulation of water pollution has been recognized as a legitimate activity. The apparatus for executing this function developed in a series of legislative acts beginning in 1948 with the creation of the Federal Water Control Advisory Board. The Water Quality Act of 1970 transferred control of water pollution from the Deparment of Health, Education and Welfare to the Environmental Protection Agency (EPA). In 1972, amendments to the Federal Water Pollution Control Act strengthened federal control in several major areas. Extension of federal jurisdiction to all navigable waters including territorial seas involves a possible violation of the Commerce Clause which has not yet been determined by the Supreme Court. Research programs have been revised. The EPA must now coordinate research efforts with HEW, and the Coast Guard has jurisdiction over research of marine pollution. Grants for construction of public waste treatment have been established. Manufacturers are now required to monitor discharges at point sources of pollution and the records must be made available to the EPA. Specific and immediate enforcement procedures enable the EPA to proceed against a violator when the state where the violation occurs fails to take appropriate action within 30 days of the alleged violation. **ORICAL GUIDE TO FEDERAL WATER LUTION CONTROL LAWS AFFECTING D PROCESSING,**
omic Research Service, Washington, D.C.
Emerson.
able from Superintendent of Documents, Gov't Printing Office, Wash, DC, as 1:543, ERS-543. February 1974. 10 p, 8 ref, 1

riptors: *Governmental interrelations, eral jurisdiction, *Penalties(Legal), *Food ssing industry, Water pollution control, Water quality standards, Regulation, Water quality, Water utilization, State jurisdiction, History, Economics, Federal Water Pollution Control Act, Permits, Water resources development, Rivers and Harbors Act, Law enforcement, Water permits, Local governments.
Identifiers: *Environmental impact statement, History of federal regulation.

The role of the federal government in controlling water pollution originally emphasized financial support of state programs. Increasing federal concern led to the Federal Water Pollution Control Amendments of 1972, and use of effluent limitations and discharge permits. Deadlines for best practicable and best available standards were set of 1977 and 1983 respectively. Plants discharging to municipal facilities will be required to satisfy pretreatment standards and pay part of municipal capital and operating costs. The broad goals of current federal statutes are primarily concerned with area-wide management planning and continued assistance of municipal treatment plants. (Knocke-Florida)

**THE DEEPWATER PORTS ACT OF 1974; HALF SPEED AHEAD,**
R. Meltz.
Environmental Law Reporter, Vol 5, No 3, p 50043-50048, 1975. 6 p, 34 ref.

Descriptors: *Offshore platforms, *Harbors, *Legislation, *Oil industry, *International waters, Water pollution sources, Deep water, Oil, Oil pollution, Water pollution, Oil spills, Oil wastes, Environment, Environmental effects, Transportation, Federal government, Ships, Public health, Structures, Regulation.
Identifiers: *Hazardous substances(Pollution), Class action suits, Environmental policy, Licenses.

The immediate effect of the Deepwater Ports Act of 1974 is to extend federal jurisdiction to facilities beyond the territorial waters of the United States, thus filling the regulatory void which has deterred deepwater port development. This article considers the background, purposes, provisions, strengths, and weaknesses of the Act. Proponents of the Act argue that deepwater ports will aid the importation of oil and provide an economically and environmentally sound way of transporting large amounts of oil over long distances. The environmental provisions of the Deepwater Ports Act are discussed in relation to the specific environmental threats posed by superports and supertankers. Regulatory schemes set forth in the Act include preconstruction testing of potential port sites, licensing of ports by the Secretary of Transportation, and some supervision by the Environmental Protection Agency. The article discusses a wide spectrum of issues such as oil spillage, cleanup side-effects, land-based development, oceanographic effects, and human health and welfare. In conclusion the author states that the Deepwater Ports Act seems a reasonable legislative response to a complex problem. (Fernandez-Florida)

**TOXIC WATERS (DISCUSSION OF RECENT FEDERAL ACTION AGAINST WATER POLLUTION).**
Resources for the Future, Inc., Washington, D.C.
In: Resources, No 48, p 14-15, January 1975. 2 p, 1 illus.

Descriptors: *Judicial decisions, *Water pollution, *Public health, *Lake Superior, *Mining, Pollutants, Waste water(Pollution), Waste water treatment, Wastes, Water, Water pollution effects, Great Lakes, Lakes, Federal government, Legal aspects, Water law, Water Quality Act, Federal Water Pollution Control Act, Mine wastes, Water pollution sources.
Identifiers: *Hazardous substances(Pollution), Federal Water Pollution Control Act Amendments of 1972, Nuisance(Legal aspects).

Of particular interest in this issue of Resources is a discussion of the water pollution problems in Lake Superior caused by the Reserve Mining Company. Discussion focuses on the dumping of 67,000 tons of taconite tailings into the lake. As citizen concern mounted over the murkiness of the water, the federal government sued Reserve for violation of the Federal Water Pollution Control Act and the Refuse Act. Later, a substantial amount of a submicroscopic fiber was detected. Evidence exists that these fibers in the water supply might be a cause of gastrointestinal cancer. In response, the suit was amended to include the public health issue and several states and environmental groups have joined in the suit. The article further discusses the history of the case through the courts. It is not yet concluded and Reserve Mining has been allowed to continue operations pending final decision in the Circuit Court. Central to the controversy is the question whether there is sufficient evidence to conclude that the fibers are cancer-causing. Another crucial consideration is the extent of economic harm that will be caused if immediate shutdown is ordered. (Fernandez-Florida)

**THE ECONOMICS OF CLEAN WATER.**
Environmental Protection Agency, Washington, D. C.
Available from Superintendent of Documents, GPO, Washington, D.C., as EP 2.14:973. December 1973, 120 p, 60 tab.

Descriptors: *Economic feasibility, *Economic prediction, *Cost-benefit analysis, *Pollution abatement, Water pollution, Water pollution control, Water pollution treatment, Inflation(Economic), Industrial wastes, Cost analysis, Cost-benefit theory, Government finance, Industrial production.
Identifiers: *Non-point sources(Pollution), Hazardous substances.

This is the 1973 edition of a report prepared annually by the Environmental Protection Agency (EPA). After a survey of the nature of water pollution and of recent advances in understanding the subject, this document analyzes in detail the current pollution level status of 22 major rivers, ranking them in groups from 'cleanest' to 'dirtiest'. The focus then shifts to the cost of water pollution control; EPA estimates the total cost of constructing municipal treatment and collection facilities eligible for federal funding under the 1972 Federal Water Pollution Control Act (FWPCA) Amendments to by $60.1 billion. Of this sum about 35.9 billion is for treatment plants and new interceptor sewers. As for industrial plants (not including power plants), the highest estimate is that is will be necessary to invest an $11.9 billion (1972 dollars) by 1977 to meet the pollution abatement standards set for that year. In 1972, industry invested only about one billion dollars in water pollution control facilities. Various approaches to the problem of non-point source pollution are then discussed. After an analysis of the types of benefits which are derived from water quality enhancement, the different fiscal and other constraints on the achievement of desired improvements are enumerated and discussed. The study concludes with various arguments suggesting the continued feasibility of meeting the higher standards of pollution control set forth by the FWPCA Amendments of 1972 and asks but does not answer a 'fundamental question': At what point do the additional costs of controlling all sources of pollutants exceed the ad-

ditional benefits of improved water quality. (Gerlach-Florida)
W75-12233

**TOWARD A CLEANER AQUATIC ENVIRONMENT,**
Environmental Protection Agency, Washington, D. C. Office of Air and Water Programs.
K. M. Mackenthun.
Available from Superintendent of Documents, U. S. Govt Printing Office, Washington, D.C., as No 5501-00573, for $2.05. 1973, 273 p, 62 plate, 20 fig, 2 tab, 1 append, 102 ref.

Descriptors: *Pollution abatement, *Environment, *Environmental control, *Aquatic life, Water qualify, Environmental effects, Industries, Industrial wastes, Pollutants, Pollutant identification, Urbanization, Technology, Fish, Wastes, Oil, Slime, Rivers and Harbors Act, Water Quality Act, Water quality control, Lakes, Ponds, Streams.
Identifiers: Hazardous substances(Pollution), National Environmental Policy Act.

Positive action to ensure the attainment of protection from pollution and the enhancement of this country's environmental resources must be accelerated to compensate for continued pressures of population and industrial growth, urbanization, and technological changes. The key to success is dependent upon our ability to define and understand the quality and behavior of the aquatic environment. The author commences his study by examining the characteristics of the aquatic environment and environmental damage of recent years (e.g., dead fish, wastes, oil, slimes, etc.). Legal controls are then considered (e.g., the Rivers and Harbors Act of 1899, the National Environmental Policy Act of 1969, and the Water Quality Improvement Act of 1970). Consideration is also given to investigation of aquatic problems, the reporting of results, biological nuisances, health-related aquatic problems and government abatement and control programs. Investigative techniques are also described in detail for the pond, stream and lake environments. Additionally, methods of correcting the causes of slime, plant, and animal nuisances are considered. (Gagliardi-Florida)

**LIABILITY FOR OIL POLLUTION DISASTERS: INTERNATIONAL LAW AND THE DELIMITATION OF COMPETENCES IN A FEDERAL POLICY,**
Syracuse Univ., N. Y. Coll. of Law.
L. F. E. Goldie.
Journal of Maritime Law and Commerce, Vol 6, No 3, p 303-329, (1975). 27 p, 121 ref.

Descriptors: *Oil spills, *Water pollution control, *International law, Ships, Navigable waters, State governments, State jurisdiction, Supervisory control(Power), Federal government, Administration, Regulation, Jurisdiction, Coordination, Pollutant identification, Oil wastes, Nuclear wastes, Oily water, Legal aspects, Adoption and practices, International waters, Law of the sea, Treaties, Foreign countries.
Identifiers: *Absolute liability, Intergovernmental Maritime Consultative Organization(IMCO), Liability Convention(IMCO), Fund Convention(IMCO), Indemnification, Hazardous substances(Pollution), Oil Pollution Act, Territorial seas(Jurisdiction), FWPCA Amendments of 1972.

If the United States ratifies the Intergovernmental Maritime Consultative Organization's (IMCO's) Liability and Fund Conventions, the current relationship between the federal government and the states in the area of liability for oil spills will be altered. IMCO's Conventions represent a move towards absolute liability for harms caused by extrahazardous activities, and towards the establishment of an international fund providing compensation to the victims of maritime oil pollution accidents who are not otherwise protected by the Liability Convention. Adoption of these measures would make possible a uniform liability law, basis for damages, and process for recovery. The Oil Pollution Compensation Bill would make the provisions of the Liability and Fund Conventions part of the domestic law of the United States. If enacted, it would complement the Water Pollution Act Amendments of 1972 by defining and effectuating the claims of individuals and local and state government. Conflicts with pre-existing liability and indemnification laws of the various states, such as the Florida Act, would have to be worked out. However, the creation of a uniform basis of recovery, on a national level, would eliminate many inconsistencies arising from the resolution of claims under various policies and jurisdiction of the several states. (Parrish-Florida)

**LAND USE CONTROLS UNDER THE FEDERAL WATER POLLUTION CONTROL ACT: A CITIZEN'S GUIDE,**
National Resources Defense Council, Washington, D. C.
D. Donley, E. Moss, R. Outen, and G. Speth.
Environmental Law Reporter, Vol 5, p 50092-50101, May 1975. 10 p, 57 ref.

Descriptors: *Federal Water Pollution Control Act, *Land use, *Land management, Legislation, Water quality, Comprehensive planning, Land classification, Land development, Zoning, Pollutants, Water quality control, Abatement, Municipal wastes, Inter-agency cooperation, Water Quality Act, Water pollution, Water pollution control, Water pollution sources, Waste disposal, Waste treatment, Waste water(Pollution), Wastes.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Non-degradation policy, Municipal sewage treatment, Effluent limitations, Hazardous substances(Pollution), Non-point sources(Pollution).

The Federal Water Pollution Control Act Amendments in 1972 recognized that if water quality is to be protected, effective regulation of existing sources of water pollution must be coupled with land use planning and regulation of the location of new sources. Six provisions of the 1972 Amendments are concerned with planning. Section 208, the most important, provides a basis for regulating non-point sources of pollution, such as general runoff from agricultural or mining operations. Section 208 also strengthens statutory control over point source pollution by requiring establishment of regulations governing the location, modification, and construction of all facilities which may discharge pollutants. Other aspects of section 208 and a critical analysis of the Environmental Protection Agency's implementation of the section are presented in detail. Further, the 1972 Amendments mandate a non-degradation policy to prevent water bodies, whose actual water quality is better than that required by law, from being 'legally' downgraded to the standards. In addition, the Amendments provide construction standards for municipal sewage treatment plants. (Hoffman-Florida)

**1974 ANNUAL REPORT, GREAT LAKES BASIN COMMISSION.**
Great Lakes Basin Commission, Ann Arbor, Mich.
June 30, 1974. 20 p, 8 photo, 1 map, 1 tab.

Descriptors: *Lake basins, *Shores, *Great Lakes, *Comprehensive planning, *Management, Lakes, Long-term planning, Regional development, Multi-purpose projects, Economics, Water policy, Basins, Watersheds(Basins), Great Lakes Region, Planning, Coordination, Research and development, Water resources development, Future planning(Projected), Water management(Applied).
Identifiers: *Coastal zone management, Lake basin development, State policy.

A summary of the Great Lakes Basin Commission's coordinating activities is presented. Major activities include coastal zone management, shoreland damage reduction, survey of planning programs, international coordination and research, assessment of water and related land resources, public participation, and the Lake Erie Wastewater Management Demonstration Project. The Basin Commission is legally required to prepare a comprehensive plan for development of water and related land resources. This plan must include an inventory of basin resources, and an evaluation of the extent that those resources are being used, with projections for potential future use. The current status of this plan is presented, together with an analysis of other special studies carried on by the Commission. Further included, is a synopsis of the Great Lakes states' activities in water and related land resources planning fiscal year 1974. Finally, the financial statement of the Great Lakes Basin Commission is reported. (Hoffman-Florida)

**OREGON SURVEYS ITS HAZARDOUS WASTES,**
Oregon State Dept. of Environmental Quality, Portland.
P. H. Wicks, and M. Synak.
Environmental Science and Technology, Vol 8, No 13, p 1080-1084, December 1974. 5 p, 3 photo, 1 tab.

Descriptors: *Oregon, *Waste disposal, *Water quality standards, *Surveys, Industrial wastes, Sewage disposal, Legislation, Water pollution, Municipal wastes, Data collections, Evaluation, Penalties(Legal), Industries, Electric power industry, Disposal, Waste water disposal, Environmental sanitation, Water pollution control, Water pollution sources.
Identifiers: Disposal sites, Enforcement programs, Administrative regulations, Effluent limitations, Hazardous substances(Pollution).

The need for improved hazardous waste disposal practices, adequate planning, and enforcement resulted in the enactment of a waste disposal law by the Oregon Legislature. The Oregon Department of Environment Quality was given regulatory responsibility for the law. Major provisions of the law require the licensing of disposal sites, state ownership of disposal site property, and the designation of pesticide and low-level radioactive wastes as hazardous substances. To fully implement the goals of the law, surveys were undertaken to gather and evaluate information concerning all facets of hazardous waste disposal. The types of industries surveyed were selected on the basis of materials, chemicals, processes, or other factors which might result in the production of hazardous waste. The data obtained from these surveys are presented. Industries surveyed included electric utilities, metal manufacturers, paper manufacturers, and oil terminals. Utilizing the survey results, projections about future waste-related problems are given. (Hoffman-Florida)

**THOSE ELUSIVE 1985 WATER QUALITY GOALS.**
Professional Engineer, Vol 44, No 3, p 30-31, March 1975. 2 p, 3 photo.

Descriptors: *Research and development, *Comprehensive planning, *Federal Water Pollution Control Act, *Water demand, Water quality, Water management, Water supply, Water conservation, Water allocation(Policy), Pollutants, Municipal wastes, Economics, Dependable supply, Water quality control, Water policy, Technology.
Identifiers: Research and development funding, Control technology.

port of the U.S. General Accounting Office in-
es that it is doubtful that the Federal govern-
will meet the 1985 goal set by Congress to
nate the discharge of pollutants into the na-
s rivers. Current funding levels for water pol-
n research and development are the central
rs behind this grim forecast. The report in-
es that increased funding is necessary to
improvements in several vital areas.
arch is needed to determine how pollutants
nto the water, what happens to them, and their
t. Technology is needed to control pollution
industrial and non-point sources and to
mize the cost of treating municipal sewerage.
n an administrative viewpoint, there is need
a national plan to improve coordination of
r pollution research and development. Up to
present, much of the nation's water pollution
ts have been fragmented and diverse. A
al focal point is needed to coordinate the dis-
nation of research information so that
arch and development programs can be made
responsive to Environmental Protection
ncy operating programs, and the duplication of
arch efforts can be eliminated. (Hoffman-
ida)

**GH SOLID-WASTE LAWS BREWING ON TOL HILL.**
mical Engineering, Vol 82, No 2, p 56, 58,
ary 20, 1975. 2 p, 1 tab.

criptors: *Solid wastes, *Ultimate disposal,
ineration, *Landfills, Legislation, Chemical
es, Standards, Administration, Waste
osal, Waste dumps, Regulation, Permits,
ycling.
tifiers: Packaging waste, Hazardous wastes,
mical treatment, Solid-waste treatment
niques.

e stringent national legislation concerning
l waste handling is apparently in the offing.
proposed legislation focuses in two main
ctions: cutting down on packaging wastes, and
ping careful watch over hazardous wastes. All
mittees in the Senate are in agreement that
niques are needed to cope with the growing
me of packaging activity. There is a difference
pinion, however, as to the role the Environ-
tal Protection Agency (EPA) should play. The
mmerce Committee's version requires the EPA
et enforceable standards for the manufacture
packaging materials, while the Public Works
mittee only calls on the EPA to issue advisory
delines. The legislation concerning the
ardous wastes involves the establishment of a
ulatory framework that approximates current
and water legislation. The EPA would set stan-
ds and issue permits for disposal. Currently,
EPA is studying three basic technical options
hazardous waste management - incineration,
mical treatment, and special landfill. The
delines developed by these three studies will
ve to set the standards and regulations if the
posed legislation is passed. (Hoffman-Florida)

**E WATER POLLUTION PERMITTING STEM,**
ion Bank and Trust Co., Montgomery, Ala.
A. Leslie.
e Alabama Lawyer, Vol 35, No 2, p 192-201
74). 10 p.

Descriptors: *Alabama, *Permits, *State governments, *Water pollution control, Water pollution treatment, Water quality control, Governmental interrelations, Federal government, Federal Water Pollution Control Act, State jurisdiction, Water quality standards, Regulation, Law enforcement.

The Alabama Water Improvment Commission has adopted water quality standards and regulations. Enforcement mechanisms include permits which must be obtained by persons discharging pollutants, in order to avoid civil and criminal Penalties. Plans are submitted describing the facility, which may lead to a Commission study. Following public hearings, a permit is issued which specifies effluent limitations. Further controls include Attorney General prosecution following failure to appeal a Commission order. Appeal via public hearings before the Commission allows immediate enforcement by the Attorney General if the order is reaffirmed at the hearing. State permits are issued following construction, using Federal Environmental Protection Agency guidelines, and run for an indefinite period. The Commission also certifies federal permits to ensure that local sources meet the performance standards of the Environmental Protection Agency. (Knocke-Florida)

**ENFORCING INTERNATIONAL LAW: U.S. AGENCIES AND THE REGULATION OF OIL POLLUTION IN AMERICAN WATERS,**
Maryland Univ., College Park. Dept. of Political Science.
D. E. Milsten.
Journal of Maritime Law and Commerce, Vol 6, No 2, p 273-285 (1975). 13 p, 33 ref.

Descriptors: *Federal Water Pollution Control Act, *Coast Guard regulations, *Oil spills, *Federal jurisdiction, International law, International waters, Oil pollution, Law of the sea, Administrative agencies, Administrative decisions.
Identifiers: *Enforcement(International).

The 1970 Federal Water Pollution Control Act (FWPCA) prohibits discharge of oil within the twelve mile contiguous zone. Any 'visible sheen' of oil on the water subjects oil spillers to civil and criminal penalties, but the act stresses cleanup and prevention. Presidential authority and Coast Guard decisions to prosecute indicate that the United States has an option to expand and enforce international standards through simple spill definitions. The author examines the conflict between a preventive or clean-up program versus the consequences of stiff enforcement, which is inherently limited beyond waters immediately adjacent to the United States coastline. (Knocke-Florida)

**ADMIRALTY'S POWER IN RE OIL POLLUTION (STATES ABLE TO SET MORE STRINGENT PENALTIES),**
J. H. Scherr.
Natural Resources Lawyer, Vol 7, No 4, p 635-653 (1974). 19 p, 133 ref.

Descriptors: *Florida, *Oil spills, *Water Quality Act, *State jurisdiction, Federal jurisdiction, Federal-state water rights conflicts, Governmental interrelations, Reservation doctrine, Constitutional law, Pollution taxes(Charges).
Identifiers: *Strict liability.

Florida's Oil Spill Prevention and Pollution Control Act is not an unconstitutional intrusion into the federal maritime domain, nor is it preempted by the Federal Water Quality Improvement Act, although Florida's strict liability for spills from any vessel imposes standards more stringent than federal legislation. Special definition of the additional or supplemental police power and the twilight zone between state and federal powers have allowed escape from strict uniformity requirements. However, existing case law provides only a first step towards full recognition of state power to enact a law more stringent than the Federal Water Quality Improvement Act. (Knocke-Florida)

**A SOLUTION TO THE PROBLEM OF PRIVATE COMPENSATION IN OIL DISCHARGE SITUATIONS,**
T. R. Post.
University of Miami Law Review, Vol 28, No 3, p 524-550 (1974). 25 p, 138 ref.

Descriptors: *Penalties(Legal), *Oil pollution, *Oil spills, *Navigable waters, *Legal aspects, Law of the sea, Judicial decisions, Negligence, Trespass, Water pollution, Water pollution sources, Oily water, Oil, Oil wastes, Disasters, Waste water(Pollution), Oil industry, Riparian rights, Water law, Common law, International law, Water rights, Legislation, Non-structural alternatives, Federal Water Pollution Control Act.
Identifiers: *Liability(Legal aspects), Environmental policy, Federal Water Pollution Control Act Amendments of 1972, International torts, International agreements, Non-print sources(Pollution), Nuisance(Legal aspects), Territorial waters.

Discharges of oil from vessels on the navigable waters of the United States and the resultant injury to the environment and population is the topic of this article. This paper examines the question of whether those who are damaged by such discharges can adequately obtain compensation for their injuries. First the author discusses the choice of a forum for relief, that is, whether a plaintiff should institute his suit in a federal or state court. Traditional concepts of tort liability, such as trespass, negligence, and nuisance, are considered with regard to their adequacy as a basis for compensation. It is suggested that an examination of the common law concepts of tort liability from the claimant's standpoint reveals numerous inadequacies in the relief available for damage suffered as a result of a vessel's discharge of oil on navigable waters. Compensation based on maritime concepts of liability is considered. The article points out that there is no present provision for relief under any International Conventions nor under the Federal Water Pollution Control Act. Related state statues are discussed. In conclusion, the author suggests, that in order to enhance the availability of effective compensation for victims of a vessel's discharge of oil on the navigable waters of the United States, the federal government should establish a fund to provide compensation. **WATER QUALITY MANAGEMENT BASIN PLANS--POLICIES AND PROCEDURES.**
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 39, No 107, Part II, p 19631-19644, June 3, 1974. 14 p.

Descriptors: *Administrative agencies, *Regulation, *Water quality control, *Research

and development, *River basin development, Water basins, Federal government, Federal Water Pollution Control Act, Permits, Comprehensive planning, Future planning(Projected), Long-term planning, Project planning, Non-structural alternatives, Management, Water management(Applied), Water resources development, State governments, Governmental interrelations, Water conservation.
Identifiers: *Administrative regulations, *Federal Water Pollution Control Act Amendments of 1972, Environmental Protection Agency, Environmental policy, Hazardous substances(Pollution), Non-point sources(Pollution), National Pollutant Discharge Elimination System, State policy.

The purpose of this Environmental Protection Agency notice is to amend 40 CFR to add a new Part 130--Policies and Procedures for State Continuing Planning Process. Section 303(e) of the Federal Water Pollution Control Act requires each state to submit a continuing planning process which is consistent with the Act. These final regulations, which describe the necessary elements of a state's continuing planning process, provide policies and procedures for review, revision, and approval. In addition the regulations provide a mechanism for states to satisfy their responsibilities with respect to critical waters and total maximum daily loads, reports on water quality and related information, clean lakes, estimates of construction needs for publicly-owned treatment works, and federal reports on water quality. Further, 40 CFR is amended to add a new Part 131--Preparation of Water Quality Management Basin Plans. The regulations describe the requirements for preparation of basin plans and the procedures governing basin plan adoption, submission, revision, and approval. (Fernandez-Florida)
W75-12260

**IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 39, No 126, Part II, p 24114-24147, June 28, 1974. 34 p.

Descriptors: *Administrative agencies, *Regulation, *Effluents, *Iron, *Steel, Metals, Iron alloys, Alloys, Wastes, Water pollution sources, Federal government, Sewage effluents, Air pollution, Discharge(Water), Industrial wastes, Liquid wastes, Sanitary engineering, Waste water(Pollution), Waste water disposal, Water pollution.
Identifiers: *Administrative regulations, *Effluent limitations, *Pretreatment standards(Effluent), Environmental policy, Federal Water Pollution Control Act Amendments of 1972, National Pollutant Discharge Elimination System, Environmental Protection Agency.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the iron and steel manufacturing category of point sources, by amending 40 CFR, Chapter 1, Subchapter N, to add a new Part 420. Guidelines are established for the following subcategories: by-product coke, beehive coke, sintering, blast-furnace (iron), blast-furnace (ferromanganese), basic oxygen furnace (semiwet air pollution control methods), basic oxygen furnace (wet air pollution control methods), open hearth furnace, electric arc furnace (semiwet air pollution control methods), electric arc furnace (wet air pollution control methods), vacuum degassing, and continuous casting. The Environmental Protection Agency simultaneously proposes a separate provision stating the application of the limitations and standards set forth below to users of publicly owned treatment works. Notice is also given of proposed regulations setting forth the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)
W75-12264

**CANNED AND PRESERVED SEAFOOD PROCESSING POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS GUIDELINES.**
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 39, No 124, Part II, p 23134-23156, June 26, 1974. 23 p.

Descriptors: *Food processing industry, *Foods, *Administrative agencies, *Regulation, *Effluents, Crabs, Wastes, Water pollution sources, Federal government, Sewage effluents, Air pollution, Discharge(Water), Shellfish, Industrial wastes, Liquid wastes, Sanitary engineering, Waste water(Pollution), Waste water disposal, Shrimp, Water pollution, Industries, Pollutants, Canneries, Fish.
Identifiers: *Administrative regulations, *Effluent limitations, *Pretreatment standards(Effluent), Environmental policy, Federal Water Pollution Control Act Amendments of 1972, National Pollutant Discharge Elimination System, Environmental Protection Agency.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the Canned and Preserved Seafood Processing category of point sources by amending 40 CFR Chapter 1, Subchapter N, to add a new Part 408. Subcategories of processing regulated include: farm-raised catfish, conventional blue crab, mechanized blue crab, Alaskan crab, dungeness and tanner crab, Alaskan shrimp, northern shrimp, southern shrimp, and tuna. The Environmental Protection Agency simultaneously proposes a separate section stating the applicaton of the limitations and standards to users of publicly owned treatment works which are subject to pretreatment standards under the Federal Water Pollution Control Act. Notice is also given of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)
W75-12265

**FERTILIZER MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS AND PROPOSED LIMITATIONS.**
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 39, No 68, Part III, p 12832-12844, April 8, 1974. 13 p.

Descriptors: *Administrative agencies, *Regulation, *Effluents, *Fertilizers, Ammonium compounds, Nitrates, Nitrogen compounds, Phosphates, Treatment, Waste water disposal, Water pollution treatment, Treatment facilities, Administration, Federal government, Wastes, Sewage effluents, Water pollution sources, Discharge(Water), Industrial wastes, Waste water(Pollution), Water pollution, Ureas.
Identifiers: *Administrative regulations, *Effluent limitations, *Pretreatment standards(Effluent), Federal Water Pollution Control Act Amendments of 1972, Hazardous substances(Pollution).

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the fertilizer manufacturing category of point sources, by amending 40 CFR Chapter 1, Subchapter N, to add a new part 418. Subcategories regulated include: phosphate, ammonia, urea, ammonium nitrate, and nitric acid. Limitations guidelines are established representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available and economically achievable. Additionally, the Environmental Protection Agency simultaneously proposes a separate provision stating the application of the limitations and standards to users of publicly-owned treatment works which are subject to pretreatment standards under the Federal Water Pollution Control Act. Notice is given of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)

**TIMBER PRODUCTS PROCESSING POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 76, Part II, p 13942-13954, April 18, 1974. 13 p.

Descriptors: *Administrative agencies, *Regulation, *Effluents, *Lumber, *Standards, Industrial wastes, Bark, Hardwood, Federal Water Pollution Control Act, Waste water(Pollution), Water pollution, Chemical wastes, Water Quality Act, Treatment, Administration, Federal government, Trees, Permits, Legal aspects, Legislation, Water policy, Wastes, Water pollution sources, Sewage, Effluents, Discharge(Water).
Identifiers: *Administrative regulations, *Effluent limitations, *FWPCA Amendments of 1972, *Pretreatment standards(Effluent), Environmental policy, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the timber products processing category of point sources, by amending 40 CFR Chapter 1, Subchapter N, to add a new Part 429. This final rulemaking is promulgated pursuant to the Federal Water Pollution Control Act. Guidelines are established for the following subcategories: barking, veneer, plywood, hardboard-dry process, hardboard-wet process, wood preserving, wood preserving-steam, and wood-preserving-boultonizing. Additionally, the Environmental Protection Agency simultaneously proposes a separate provision stating the application of the limitations and standards to users of publicly owned treatment works. Notice is given of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)
W75-12267

**ORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS AND PROPOSED APPLICATION TO PRETREATMENT STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 81, Part II, p 14676-14685, April 25, 1974. 10 p.

Descriptors: *Administrative agencies, *Regulation, *Effluents, *Organic wastes, *Chemical wastes, Chemicals, Standards, Industrial wastes, Organic compounds, Federal Water Pollution Control Act, Waste water(Pollution), Water pollution, Water Quality Act, Treatment, Administration, Federal government, Permits, Legal aspects, Legislation, Water pollution sources.
Identifiers: *Administrative regulations, *Effluent limitations, *FWPCA Amendments of 1972, *Pretreatment standards(Effluent), Environmental policy, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources

ndards of performance and pretreatment
ls for new sources in the organic chemicals
cturing category of point sources, by
g 40 CFR Chapter 1, Subchapter N, to add
Part 416. This final rulemaking is promul-
ursuant to the Federal Water Pollution
Act. Subcategories regulated include:
ous processes, processes with water con-
steam diluent or absorbent, and aqueous
hase reaction systems. Additionally, the
mental Protection Agency simultaneously
s a separate provision stating the applica-
the limitations and standards set forth
users of publicly-owned treatment works
re subject to pretreatment standards.
s also given of proposed regulations con-
the application of effluent limitations
es for existing sources to pretreatment
s for incompatible pollutants. (Fernandez-

PRODUCTS--PROPOSED EFFLUENT
NES AND PERFORMANCES AND
ATMENT STANDARDS FOR NEW
S.
ental Protection Agency, Washington,

egister, Vol 39, No 2, Part III, p 938-949,
, 1974. 12 p.

rs: *Wood wastes, *Federal Water Pol-
ntrol Act, *Lumber, *Water quality stan-
ater pollution control, Industrial plants,
posal, Industrial wastes, Water pollution

sources, Pulp wastes, Lumbering, Pulp and paper industry, Construction materials.
Identifiers: *Plywood, *Veneer, Timber products processing.

Subcategories under the timber products processing category of the Federal Water Pollution Control Act are regulated as eight subcategories, according to their effluent characteristics, and classed as new point sources under this proposed regulation. Subcategories of barking, veneer, plywood, hardboard-dry process, hardboard-wet process, wood preserving, wood preserving-steam, and wood preserving boultonizing are each considered according to waste categorization, treatment and control technology, daily maximum effluent limitations, non-water quality aspects of pollution control, economic impact analysis. A summary of public participation and comment is provided. (Hoffman-Florida)
W75-12270

**BEET SUGAR PROCESSING POINT SOURCE SUBCATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 22, Part II, p 4034-4040, January 31, 1974. 7 p.

Descriptors: *Sugar beets, *State governments, *Odor, State jurisdiction, Condensation, Fog, Water pollution, Discharge(Water), Sugar crops, Air pollution effects, Agriculture, Energy conversion, Energy dissipation.
Identifiers: *Beet sugar.

The beet sugar subcategory within the point source category of sugar processing, under the Federal Water Pollution Control Act, establishes final effluent limitation guidelines on performance and pretreatment standards for new sources in the subcategory. The Environmental Protection Agency also applies these standards to users of publically-owned treatment works, but only those subject to pretreatment standards under the Act. Final regulations differ from those proposed, in regulation of plants by 1983 effluent guidelines and monolithic subcategorization of the industry. Energy requirements, fogging from condenser water, odor from increased land disposal, definition of effluent load and effect on state water rights are also specifically covered by the final regulation. (Hoffman-Florida)
W75-12271

**FERTILIZER MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS AND GUIDELINES.**
Environmental Protection Agency, Washington D.C.
Federal Register, Vol 39, No 195, Part II, p 36094-36099, October 7, 1974. 6 p.

Descriptors: *Fertilizers, *Water pollution sources, *Federal Water Pollution Control Act, *Ammonium compounds, Chemicals, Agricultural chemicals, Water pollution, Energy, Fertilization, Administrative agencies, Data collections, Data transmission, Pretreatment(Water).
Identifiers: *Mixed and blend fertilizers.

Proposed effluent limitations and guidelines for new sources within the fertilizers category add subcategories of ammonium sulfate and mixed and blend, under the Federal Water Pollution Control Act and its administration by the Environmental Protection Agency. Point source effluents are to meet the best practicable and best available standards by 1977 and 1983 respectively, and new categories data and standards are to be periodically developed according to the unique requirements and technologies of pretreatment standards. Ammonium sulfate produces waste in water as ammonium, while mixed and blend fertilizers produce no direct liquid waste. Specific treatment and control technology, costs, energy requirements, and public and administrative reaction to the proposals are considered. (Hoffman-Florida)
W75-12272

**MEAT PRODUCTS POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 41, Part II, p 7894-7908, February 28, 1974. 15 p.

Descriptors: *Effluents, *Industrial wastes, *Water quality standards, *Regulation, *Waste treatment, Wastes, Water pollution sources, Discharge(Water), Water pollution standards, Control, Performance, Administrative agencies, Federal government, Treatment, Waste water treatment, Cleaning, Environmental effects.
Identifiers: *Administrative regulations, *Effluent limitations, *Federal Water Pollution Control Act Amendments of 1972, *Pretreatment standards(Effluent), *Environmental Protection Agency, Environmental policy, Hazardous substances(Pollution).

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the meat products category of point sources, by amending 40 CFR Chapter 1, Subchapter N, to add a new Part 432. Guidelines are promulgated for new sources within the simple slaughterhouse, complex slaughterhouse, low-processing packinghouse, and high-processing packinghouse subcategories. Further delineated are effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available, as well as the best available technology economically achievable. In addition, the Environmental Protection Agency proposes a separate provision which states the application of the limitations and standards to users of publicly owned treatment works which are subject to pretreatment standards under Federal Water Pollution Control Act. Notice is also given, pursuant to the Act, of proposed regulations concerning the application of effluent limitations guidelines for incompatible pollutants. (Fernandez-Florida)
W75-12273

**GRAIN MILLS POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 55, Part II, p 10512-10520, March 20, 1974. 9 p.

Descriptors: *Administrative agencies, *Regulation, *Effluents, *Mills, *Grains(Crops), Wheat, Rice, Corn(Field), Standards, Water pollution, Treatment, Water treatment, Waste treatment, Federal government, Wastes, Water pollution sources, Sewage effluents, Discharge(Water), Industrial wastes, Waste water(Pollution), Waste water disposal.
Identifiers: *Administrative regulations, *Effluent limitations, *Pretreatment standards(Effluent), Federal Water Pollution Control Act Amendments of 1972, Hazardous substances(Pollution), Environmental Protection Agency.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the grain mills category of point sources by amending 40 CFR Chapter 1, Subchapter N, to add a new Part 406. Subcategories regulated include: corn wet milling, corn dry milling, normal wheat flour milling, bulgur wheat flour milling, normal rice milling, and parboiled rice processing. These regulations

govern the discharge of pollutants into navigable waters. Additionally, the Environmental Protection Agency hereby gives notice of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. Further, rules are proposed to regulate users of publicly owned treatment works which are subject to pretreatment standards. (Fernandez-Florida)
W75-12274

**PLASTICS AND SYNTHETIC POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**

**WATER CONSERVATION IN SWEDEN: IL POLLUTION CONTROL,**
National Swedish Environment Protection Board, Stockholm.
A. Liedberg, and I. Olsson.
Journal Water Pollution Control Federation, Vol 47, No 4, p 669-672, April, 1975.

Descriptors: *Legislation, *Waste water treatment, *Pollution abatement, Urbanization, Population, Detergents, Eutrophication, Bodies of water, Environmental effects, Treatment facilities, Municipal wastes, Sludge treatment, Sludge disposal.
Identifiers: *Sweden, Environmental Protection Act.

During the last century there has been a definite redistribution of population in Sweden from almost 90% rural to over 80% urban. At the same time the population has doubled. Heavy pollution in lakes, rivers, and coastal waters occurred as a result of the urbanization, population growth, and municipal waste regulations. Eutrophication was increased by the use of synthetic detergents. In the 1960's the Swedish government instituted action programs and policy goals to prevent further deterioration of the environment. The Environmental Protection Act became effective in 1969 to regulate the use of land and supervision of activities hazardous to the environment. Prior to the enactment of the Environmental Protection Act only 50% of the urban households were connected to biological treatment plants, 25% to primary treatment plants, and 25% no treatment plants. Presently 50.6% are connected to chemical and biological/chemical treatment, 40.6% biological treatment, 7.8% sedimentation and 1% no treatment. Technological progress and governement grants as well as legislation and political goals resulted in this rapid progress. Guidelines for the treatment and disposal of sludge are in preparation. Positive effects of these programs have been the restoration of heavily polluted areas, decrease in algal growth, and a recolonization by fish. (Dean-FIRL)

istory of the O'Hare Water Quality Section
Department of Aviation, City of Chicago, Il-
, is discussed from its beginning in October
to the present. The ultimate objective of the
am is to allow the airport to maintain strict
liance with existing and future regulations
gh continuous monitoring and testing. The
re International Airport has the typical
tions of most major airports including: air-
fueling and maintenance; vehicle servicing;
ft lavatory servicing; continuous construc-
and remodeling; land fill; and, grading. A
r Quality Control Program has been
oped. An emergency oil spill plan is part of
aster program. Communication equipment,
ble booms, sorbent material, pump-out and
ning equipment, shovels, sledgehammers,
, lines, boots, lifejackets, available holding
and earth moving equipment are some of
uipment necessary for an efficient oil con-
ent and removal program. The Technical
ittee for Present and Future Water Control
cts was formed to be representative of all the
s of the airport. The committee will discuss
ons and common problems, pass resolu-
and field test proposed solutions. The
ishment of a Master Water Quality Control
am is believed to be necessary for the com-
e with present and future water quality stan-
at any airport. The program instituted at
e may also be applied to tank farms, railroad
als, and industrial complexes. (Orr-FIRL)

orth West Water Authority covers the area
northwest England including Liverpool,
ester, and the Lake District with a popula-
f approximately seven million. For many
the water supply for both Manchester and
ool has come from the Lake District and
Wales. As a result little concern was shown
the discharge of effluents into the rivers
g pollution. Some of the tasks facing the
West Water Authority are improving water
ution in rural areas, sewerage in the rural
and the pollution in the Mersey Belt and
arts of the region. Future industrial and re-
al development of the area is an important
in the North West Water Authority's capital
g along with cooperation with the local
ties. The future organization of the
ity will include seven divisions, five of
will be in the heavily populated southern
the area. There will be a single division for
nanagement. Water recreation needs are
r of the Authority's concerns. The Lake
t is a well known recreational area as well as
stal resorts. Some of the coastal waters are
table for boating or other water sports. The
ty hopes to expand recreation on the waters
its jurisdiction nearer population centers.
evelopment of fisheries and recreational
s as well as the clean up of coastal waters,
and estuaries will require major invest-

**WATER QUALITY MANAGEMENT IN A METROPOLITAN AREA,**
British Columbia Univ., Vancouver. Westwater Research Centre.
A. H. J. Dorcey, and K. J. Hall.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 195-217. 4 fig, 11 tab, 8 ref.

Descriptors: *Municipal wastes, *Water pollution sources, *Water pollution control, *Water quality control, Biochemical oxygen demand, Indicator organisms, Coliforms, Pesticides, Chlorinated hydrocarbons, Heavy metals, Rivers, Nutrients, Nitrogen, Phosphorus, Phenols, Organic pollutants, Canada, Foreign research.
Identifiers: Lower Fraser River, Vancouver(B.C.).

The information required for water quality management in a metropolitan area, specifically the Lower Fraser Estuary of metropolitan Vancouver, British Columbia, Canada, is discussed. The parameters to be considered in water quality management include dissolved oxygen, BOD, pollution indicator microorganisms (total coliforms, fecal coliforms, and fecal streptococci), nutrients (mainly nitrogen and phosphorus), trace metals, pesticides, and other toxic substances, such as hydrocarbons, phenols, and other organic compounds. The data collected show that pathogenic microorganisms, trace metals, and pesticides resulting from the metropolitan Vancouver area all present potential pollution problems. Information must be generated to determine the sources of these pollutants if the quality of the water environment in the Lower Fraser is to be managed. The information presently available is inadequate for determining the sources and for developing management plans. Data from the California Bight and New York City are illustrated to show the importance of pollution source information in determining whether the implementation of a particular management plan will be effective in producing the desired improvement in water quality. Current studies are being performed to provide a better understanding of the significant sources of these pollutants and the opportunities for their most cost-effective control. **CANADIAN DRINKING WATER SURVEILLANCE PROGRAMS, PANEL DISCUSSION,**
Nova Scotia Dept. of Public Health, Halifax. Div. of Public Health Engineering.
C. E. Tupper.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 243-245.

Descriptors: *Potable water, *Water supply, Water quality, *Canada, Standards, Water treatment, Chlorination, Filtration, Corrosion control, *Water quality standards.
Identifiers: *Canadian Drinking Water Standards and Objectives.

The Canadian Water Standards and Objectives are currently used by each of the Atlantic provinces of Canada as either a legal requirement or as a reference guideline for evaluating and assessing municipal water supplied. All of the public systems in Prince Edward Island meet the Standards mainly because the public supplies there are all groundwater. In Nova Scotia, New Brunswick, and Newfoundland, the majority of public water supplies are surface water sources; many of these public systems cannot meet the requirements of the Standards during the winter. Upgrading of the public systems has included the installation of pH adjustment, filtration plants, and appropriate chemical feed systems for chlorination. Although there is a general soft water corrosiveness of the water, chemical quality is not a major problem in the Atlantic Provinces. The Canadian Standards can be achieved in the long run in these provinces without any difficulty. However, a period of several years will be needed to bring all systems to the desired quality level. The Canadian Drinking Water Standards and Objectives have been an important aid in establishing better drinking water surveillance programs in the Atlantic Provinces, and in encouraging an improvement in overall quality of the public water supplies. W75-12355

**CANADIAN DRINKING WATER STANDARDS REVIEW, ONTARIO'S PROGRAMS, PANEL DISCUSSION,**
Ontario Ministry of the Environment, Toronto. Contingency Planning Section.
G. H. Kay.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 247-252.

Descriptors: *Water treatment, *Potable water, Standards, Canada, Treatment facilities, Filtration, Disinfection, Pathogenic bacteria, Groundwater, Surface waters, *Water quality standards.
Identifiers: *Canadian Drinking Water Standards and Objectives.

A review is presented of the Canadian Water Standards with respect to the actions necessary to achieve these goals. The implementation of drinking water standards or objectives is highly desirable and permits a technical assessment to be made of the product being provided. The Ontario Ministry of the Environment is starting the E.D.P. storage and retrieval of water analysis results to accelerate the assessment of water quality. The Province of Ontario is initiating a program of training, leading to the mandatory certification of water treatment plant operators. Miniaturization of the sampling units would aid in organic chemical determinations. The Ministry is trying to protect the natural waters since the quality of the water source affects the quality of the drinking water. Legislation since 1957 has encouraged advanced treatment of waste flows and drinking waters. The presence-absence test, a simple modification of the most probable number method, is used in addition to the multifilter technique to provide a sensitive test of the presence of pathogenic microorganisms. Other steps taken to ensure the best possible drinking water include: detection of asbestos fibers in drinking water by electron microscopy; monitoring organic chemicals; filtration as well as disinfection treatment is required of all surface water supplies; water reservoirs must be covered; automatic continuous recording analyzers for turbidity and chlorine residuals are required at filtration plants; and, regionalization is encouraged to discourage the growth of small plants. W75-12356

**CANADIAN DRINKING WATER STANDARDS REVIEW, ALBERTA, SASKATCHEWAN AND MANITOBA, PANEL DISCUSSION,**
Department of the Environment, Edmonton (Alberta). Div. of Pollution Control.

R. N. Briggs.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 253-256.

Descriptors: *Potable water, *Water supply, Standards, Water quality, Canada, Ground water, Surface waters, *Water quality standards.
Identifiers: *Canadian Drinking Water Standards and Objectives.

The Prairie Provinces of Canada, Alberta, Saskatchewan, and Manitoba, have accepted the Canadian Drinking Water Standards but due to physical limitations the Standards are used more like guidelines. The surface water and groundwater qaulity decreases from Alberta through Saskatchewan to Manitoba. The Province of Manitoba has adopted the Canadian Drinking Water Standard with the modification that their optimum fluoride level is 1.0 mg/liter, with an operating range from 0.8 to 1.2 mg/liter. Of the 199 water works systems in Manitoba, only 4 use water that meets the Water Quality Objectives, 24 use acceptable water, and the remaining 72% use water outside of the Standards. The Province of Sadkatchewan uses the values corresponding to the Maximum permissible limit in the Drinking Water Objectives. The Objective Values have been modified: sodium limit = 300 mg/liter; sulfate limite = 500 mg/liter; T.D.S. = 1500 mg/liter; hardness = 800 mg/liter; alkalinity = 500 mg/liter; and, phenolics = 0.001 mg/liter. The Province of Alberta has adopted the Canadian Drinking Water Standards, with the exceptions as determined by the Director of Standards and Approvals. (See also W75-12350) (Orr-FIRL)
W75-12357

**CANADIAN DRINKING WATER STANDARDS REVIEW, BRITISH COLUMBIA, PANEL DISCUSSION,**
British Columbia Dept. of Health, Vancouver. Environmental Engineering Div.
W. Bailey.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 257-261.

Descriptors: *Potable water, *Water supply, *Water quality standards, Standards, Canada.
Identifiers: *Canadian Drinking Water Standards and Objectives.

The quality of the potable water supplies in British Columbia, Canada, and measures taken to protect the drinking water are discussed. The B.C. Health Branch has published 'Recommended Water Quality Standards', however, this document has no legal standing. The part of the standards dealing with potable water supplies is similar to the Canadian Drinking Water Standards. Very few of the water works systems in B.C. have full water treatment. Data processing storage and retrieval of waterworks information is just beginning to be implemented. An annual Water and Waste School is held at the University of British Columbia to produce well trained, competent operators for the waterworks systems. Open reservoirs on waterworks distribution systems must be covered or abandoned. The following programs must be initiated with supporting legislation and staff: controlled multiple use of watersheds to protect raw water quality; establishment of minimum drinking water quality standards for bacteriological, chemical and physical characteristics; prevention of contamination of water in the distribution system by cross-connection control programs, increasing water pressure, prohibiting open reservoirs, and promoting proper maintenance programs; consolidation of small water systems into larger, better managed systems; and promotion of waterworks operator training and certification. (See also W75-12350) (Orr-FIRL)
W75-12358

**CANADIAN DRINKING WATER STANDARDS REVIEW, NORTHWEST TERRITORIES AND YUKON TERRITORY, PANEL DISCUSSION,**
Environmental Protection Service, Edmonton (Alberta). Northwest Region.
J. W. Grainge.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, British Columbia, p 261-263.

Descriptors: *Water supply, *Potable water, *Water quality standards, Standards, Canada, Sewers.
Identifiers: *Canadian Drinking Water Standards and Objectives.

The control of water supplies in the two northern territories of Canada is discussed. The Canadian Drinking Water Standards are used as a guide for water quality. Half of the people in the two territories use water which meets, or nearly meets, the Standards. Most of the rest of the people have access to good quality water although the water is subject to contamination during haulage and storage. Bacterial contamination, color, and turbidity are the parameters which are not met in the substandard water. Water wells are fairly productive in the Yukon Territory but are not used in the Northwest Territories because of the high mineralization of the water. Administrative control of water quality in most communities is performed by self-governing councils which accept advice from the local offices of the Department of National Health and Welfare and the area MHO's and EHO's. The local health officer should supervise the water sampling for bacteriological control and the testing for chlorine. The greatest need in the northern Canadian territories is for community planning so that water mains and sewers can be constructed. (See also W75-12350) (Orr-FIRL)

**A BAYESIAN FRAMEWORK FOR THE USE OF REGIONAL INFORMATION IN HYDROLOGY,**
Resource Analysis, Inc., Cambridge, Mass.
G. J. Vicens, I. Rodriguez-Iturbe, and J. C. Schaake, Jr.
Water Resources Research, Vol 11, No 3, p 405-414, June 1975. 12 fig, 4 tab, 18 ref. OWRT C-4118(9021)(9).

Descriptors: *Decision making, *Risks, *Streamflow, *Regional analysis, Hydrology, Statistical methods, Analytical techniques, Stochastic processes, Regression analysis, Hydrologic data, Streamflow.
Identifiers: *Bayesian methodology, *Model uncertainties, Synthetic generation, Prior probability distribution function, Maximum likelihood estimates.

Water resource designs are perfrect examples of decision making under uncertainty. In fact, three types of uncertainties may exist in any design problem: natural, parameter, and model uncertainties. The last two may be considered as informational uncertainties that are due to the lack of perfect information about the streamflow processes. The use of regional information has been suggested as a technique for reducing parameter uncertainties. The use of Bayesian methodology provides a framework for combining regional information with at-site historical records. Moreover, Bayesian methods allow the hydrologist to consider the parameter uncertainties as well as the natural uncertainties within the decision-making process. Because of these two advantages the Bayesian approach is a more complete and realistic approach to problems of uncertainty in hydrology and water resource planning than presently used methodologies. **SEWER SYSTEM EVALUATION AND REHABILITATION COST ESTIMATES,**
H. Farmer.
Water and Sewage Works, Reference number, p 8-9, April 30, 1975.

Descriptors: *Sewers, *Construction costs, Cost allocation, Infiltration, Inflow, Waste water treatment.
Identifiers: Sewer inspection, Sewer rehabilitation.

A method is outlined for developing sewer system evaluation and rehabilitation cost estimates for infiltration/inflow analyses. This cost estimation method is based on calculating rehabilitation costs for eliminating both excessive infiltration and inflow in a sewer system. Rehabilitation costs for infiltration were determined to equal the sum of costs for each infiltration source and each manhole reach to be grouted. A total inflow rehabilitation cost can be computed by adding the costs for individual inflow sources (such as from leakage or holes in manhole covers, foundation drains, catch basins, ditch or storm sewers, or area drains). A complete sewer system evaluation survey consists of five phases: physical survey, rainfall simulation, preparatory cleaning, internal inspection, and survey report. An estimated cost of the complete survey is $0.65 to $0.95 per foot for the total length of the sewer system. A cost-effective evaluative survey is one where results of the physical survey and rainfall simulation are used to determine the actual sewer segments which require cleaning and internal inspection. It is recommended that actual costs of the evaluation be established by a cost plus a fixed fee, a fixed price, per diem, salary multiplier, or by a closed end contract. (Kramer-FIRL)

## 6D. Water Demand

**PLANNING MODELS FOR WATER SYSTEM DEVELOPMENT IN MISSISSIPPI COMMUNITIES,**
Mississippi Univ., University. Dept. of Economics and Finance.
E. W. Wood, and S. C. Shull.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 260, $3.75 in paper copy, $2.25 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, 1975. 32 p, 23 tab, 1 fig. OWRT A-082-MISS (1).

Descriptors: *Mississippi, Data collections, *Water utilization, Mathematical Models, Planning, Water Supply, *Water demand, *Consumptive use, *Long-term planning, *Projections, Model studies.

The purpose was to develop a practical model whereby local government officials can project future water demand to facilitate economical long range planning. Water consumption data gathered from individual cities in Mississippi were compared by statistical techniques with other readily available data about the communities (population, income estimates, rainfall, temperature and so on) to determine what combination of factors can be used to project water consumption most accurately. Only readily available statistical comparisons were used because the models are to be used by local officials who will have limited sophistication in statistical techniques and limited time and funds to spend preparing the projections. (Orr-FIRL)

**WATER CONSUMPTION TRENDS WITHIN THE CENTRAL AND SOUTHERN FLORIDA FLOOD CONTROL DISTRICT,**
Central and Southern Florida Flood Control District, West Palm Beach. Resources Planning Dept.
A. Kreitman, R. H. Walker, and J. A. Beck.
Technical Publication 74-3, May 1974. 32 p, 12 fig, 2 tab, 14 ref.

Descriptors: *Water utilization, *Consumptive use, *Water demand, *Florida, Use rates, Water supply, Aquifers, Groundwater, Hydrology, Climatology, Water requirements, Water sources, Water management(Applied).

The use (consumption) of potable water in southeastern Florida is of primary interest to planners, engineers, and the regulatory agency responsible for effective and efficient management of available water resources. The unique climatologic position southeastern Florida occupies was recognized, and the changes and range of per capita use of potable water supplies due in part to this uniqueness were examined. Per capita use of potable water in Florida, the South Atlantic Gulf Region, and the nation was compared with the per capita use in southeastern Florida. These studies indicated that per capita potable water use within the Central and Southern Florida Flood Control District has a rather broad range and centers about a significantly higher per capita use than is found in other parts of the state and nation. Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
G. L. Goodwin.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 572, $4.75 in paper copy, $2.25 in microfiche. M.S. Thesis, May, 1975. 68 p, 27 fig, 4 tab, 16 ref. OWRT B-028-OKLA (1).

Descriptors: *Water distribution(Applied), *Rural areas, Water delivery, *Water demand, *Water users, *Water utilization, Domestic water, Dairy industry, *Design criteria, Pumping, *Water supply, Oklahoma.

An analysis was made of the water usage in the Rural Water District No. 3 Payne County, Oklahoma. Customers were categorized on the apparent economic value of their residence and were classified as Class A, Class B, or dairies. The monthly usages of each of these groups were analyzed to obtain patterns of usage. The patterns of usage were then used to determine the values of daily demand and peak demand expected for type of user. There was a significant difference in the usage pattern for the three classes of customers. The average monthly usage per tap was 8768-19,138 gal for dairies, 4357-11,983 gal for Class A taps, and 2537-4160 gal for Class B taps. The average monthly usage per person ranged from 1424 to 2821 gal for Class A taps and from 989 to 1664 gal for Class B taps. Optimal design values for daily demand were 200 gal per Class B tap, 350 gal per Class A tap, 600 gal per Dairy tap, 12 gal per dairy cow milked, 90 gal per person for a Class B tap, and, 150 gal per person for a Class A tap. The optimal design values for peak demand were 1.3-1.8 gal per minute per Class A tap, and 0.6-0.9 gal per minute per Class B tap. The optimal period off-peak pumping time was from 10 p.m. to 7 a.m. (Orr-FIRL)

**FEDERAL OCEAN PROGRAMS REVIEW.**
Hearings--Subcomm. on Oceanography, Comm. on Merchant Marine and Fisheries, U. S. House of Representatives, 93d Cong, 2d Sess, March 26, 29, April 11, 1974. 343 p.

Descriptors: *Oceanography, *Oceans, *Project post-evaluation, *Atmosphere, *Administrative agencies, Coordination, Legal aspects, Legislation, Management, Federal Government, Administration, Comprehensive planning, Bodies of water, Surface waters, Law of the sea, Marine biology, Marine fisheries, Sea water, Air environment, Air pollution, Project planning, Projects, Environment, Aquatic environment.
Identifiers: *Congressional hearings, *Environmental policy, Energy crisis, International agreements.

Hearings were held by the House Subcommittee on Oceanography to consider the various aspects of the Federal Ocean Programs and the interagency coordination of ocean activities. Extensive testimony was received from the National Advisory Committee on Oceans and Atmosphere, which is required to undertake a continuing review of the progress of the marine and atmospheric science and service programs of the United States, and to submit a comprehensive annual report setting forth an overall assessment of the status of the Nation's marine and atmospheric activities. Particular attention was given to the Advisory Committee's second annual report. The subcommittee addressed itself in detail to all aspects of marine science activities and to the relationships of the various departments and agencies which have not received careful legislative review in the past few years. Since January 1969, several pieces of legislation and several administrative iniatives have occurred. The central question sought to be answered by the subcommittee was whether there has been adequate advancement on ocean problems as a result of these legislative and administrative initiatives. **INTERNATIONAL LAW, U.S. SEABEDS POLICY AND OCEAN RESOURCE DEVELOPMENT,**
Virginia Univ., Charlottsville.
K. Clarkson.
The Journal of Law and Economics, Vol 17, p 117-142 (1974). 26 p, 58 ref.

Descriptors: *Law of the sea, *International commissions, *Resource allocation, *Resources development, *United Nations, *United States, International waters, Water pollution control, Jurisdiction, Legal aspects.
Identifiers: *Coastal waters, *Territorial seas, *Non-navigational uses, Comparative law, International agreements, U.N. Convention on the International Seabed Area, Truman Proclamation, Seabed.

Existing international agreements and institutions governing use of the ocean's resources are unsatisfactory. The allocative consequences of proposals under study need to be examined. Since certain ocean industries such as oil extraction and fishing conflict with each other, ownership of the seas is a crucial issue. This development renders the historical doctrine of 'freedom of the seas' obsolete. Since the early nineteenth century regulation of international fishing rights has mainly been accomplished by bilateral agreement. Inherent in most proposals is the idea that the net returns from the seas should be as high as possible. The requirement of conflicting industries make this objective impractical. One proposal which attempts to resolve the problem is the U.S. draft articles to the U.N. on the Rights and Duties of States in the Coastal Seabed Economic Area (CSEA). The proposal grants to coastal states exclusive rights to nonnavigational use of the seabed. (Jenkins-Florida)

**THE INTEGRATIVE POTENTIAL OF THE PROPOSED INTERNATIONAL REGIME FOR THE SEABED.**
Iowa Law Review, Vol 60, p 148-173, 1974. 26 p, 251 ref.

Descriptors: *Oceans, *International waters, *International law, *Jurisdiction, Water law, Water, Environment, Sea water, Water policy, Continential shelf, Economics, Exploitation, Mineralogy, Ecology, Ecological distribution, Economics, Prices, Resources, Environmental control, Environmental(Effects), Regime.
Identifiers: International agreements, Territorial seas(Jurisdiction), Territorial waters.

Whether an international regime for the seabed develops a significant capability to make authoritative decisions for the international community depends to a great extent on how a number of major policy issues concerning the establishment of such a regime are resolved. Important issues which demand consideration are the limits of national jurisdiction, the powers of an international regime, the structure and voting of such a regime, and the enforcement of its decisions. There are three main categories of claims to national jurisdiction over the oceans: claims to territorial waters, claims to the continental shelf, and claims to economic resource zones. The resolution of issues concerning the powers of an internationl regime involves consideration of the exploitation of mineral resources, ecological powers, price controls, and distributors of economic aid. The utility of a seabed regime is manifested by the possibility of providing an orderly means for the exploitation and minimization of the possibility of conflict over ocean resources. Such a regime could promote international cooperation and also play a major role in promulgating rules for environmental protection. Additionally, the concept that seabed resources are 'the common heritage of mankind' to be exploited only through an international regime may provide practical experience in joint decision-making which, if successful, will encourage future efforts in other areas. **THE LAW OF THE SEA: A SELECTIVE BIBLIOGRAPHY OF ARTICLES, DOCUMENTS AND MONOGRAPHS,**
Columbia Univ., New York. School of Law.
J. T. Vambery.
Columbia Journal of Transnational Law, Vol 13, p 173-186, 1974. 14 p, 181 ref.

Descriptors: *Sea water, *Oceans, *International law, *International waters, Resources, Exploration, Exploitation, Water, Water law, Water policy, Water resources, Water resources development, Water rights, Water users.
Identifiers: Coastal waters, International agreements, Territorial waters.

While the prospects for a universally binding law of the sea are uncertain, there is already a pressing need to begin long-term ocean resource exploration and expolitation. Several countries have unilaterally engaged in practices violative of existing international law. Other nations have been prompted to make unilateral regulations of some ocean uses in anticipation of generally acceptable future international regime of the seas. The American Society of International Law has recognized the urgent need to find a temporary, but immediate, solution to the problems raised by ocean resource exploration and exploitation pending the adoption of a permanent international regime. The 1974 annual Philip C. Jessup International Moot Court Competition presented a legal problem similar to that which will be faced by the United States Congress in enacting its current unilateral regulation bill, and by the international community in connection with its attempted enforcement. Identifiers: *Helsinki Rules, Limited territorial sovereignty, International Law Association, Equitable utilization(Doctrine), Territorial waters, Sovereignty, Third World.

Changing national boundaries and improved technology require a study of the law regarding international rivers. The prevailing position today is that nations must consider the effect of their river development on their riparian neighbors and compensate them for any resulting injury. The extent of these rights is governed by the doctrine of equitable utilization set forth by the International Law Association in the Helsinki Rules. Under this doctrine, each river basin state is entitled to a reasonable and equitable share in the beneficial use of waters of an international drainage basin. The term beneficial does not require that the most beneficial use be made of the waters, thus allowing states with differing technologies to share equally in the waters. The Rules also provide for apportioning water among competing interests based on

prescribed factors. One problem yet to be resolved in reservation of water rights for future use. The Helsinki Rules do not recognize such a right. Developing riparian states have no guarantee that a minimum level of hydroelectric power will be available to operate plants under construction. Treaties present a possible solution to this problem because they deal with specific situations. (Jenkins-Florida)

**THE DEVELOPMENT OF EUROPEAN REGIONAL LAW OF THE SEA,**
Naval Postgraduate School, Monterey, Calif.
M. W. Janis.
Ocean Development and International Law Journal, Vol 1, p 275-289 (1973). 15 p, 1 tab, 34 ref.

Descriptors: *Sea water, *Oceans, *International law, International waters, International commissions, Fisheries, Fishing, Fish, Treaties, Continental shelf, Water, *Europe, Regime.
Identifiers: Coastal waters, International agreements, Territorial waters.

The development of regional law of the sea may be more practical than a new global order for the oceans and may be preferable to the extension of national maritime jurisdictions. The Common Market has taken two important steps toward creating a European system of maritime law--the European Economic Community (EEC) Common Fisheries Policy and the EEC Commission's decision applying the Treaty of Roue and EEC regulations to the continental shelf. The former opened national territorial waters within the EEC to all Community fishermen and provided the foundation for the generation of Common Market fishing policy. The latter brought the exploration and exploitation of hydrocarbons on the shelf within EEC regulations and supervision. Other European organizations (the Bow Group, the Council of Europe, and the Western European Union) have proposed various non-EEC regimes for maritime legislation and cooperation, but no non-EEC proposal seems likely to be implemented. The future of European law of the sea lies with the Common Market which can make an important contribution to European maritime order. If a European solution to maritime problems is not the global solution, it is still a model of regional cooperation for other areas of the globe. (Gagliardi-Florida)

**UNDERSTANDING THE OCEAN SCIENCE DEBATE,**
Woods Hole Oceanographic Institution, Mass.
H. T. Franssen.
Ocean Development and International Law, Vol 2, p 187-202 (1974). 16 p, 41 ref.

Descriptors: *Oceans, Technology, *Research and development, *Resources development, *Water resources, Research priorities, Water, Coasts, Water law, Water policy, Water rights, Resources.
Identifiers: Coastal waters, Coastal zone management, International agreements, State policy.

Several spokesmen for the American ocean science community have indicated their approval of providing technical assistance in the marine sciences to developing countries in return for uncontrolled access to coastal waters beyond narrow territorial limits for scientific research. The author doubts whether technical assistance will work as a quid pro quo for obtaining unrestricted access to the proposed resource since developing countries, which have expressed a strong desire to control foreign-conducted research in the proposed resource zone are not likely to relinquish sovereign rights over parts of their claimed 'national territory' for a vague promise of technical assistance. Additionally, nations move through various stages of scientific and technological development from complete dependence on foreign science and technology to the development of an independent scientific tradition. There is historical evidence to suggest that when nations are progressing in the direction of an indigenous scientific capability they tend to restrict access to their national territory. When the transition towards an independent scientific capability has been completed, restrictions on foreign conducted science tend to subside. Because most developing countries are now somewhere between the stage of complete dependence on foreign science and the final independent state, restrictions on foreign conducted oceanic research are likely to grow within their national territories. The offer of technical assistance in the marine sciences is not likely to change their positions. (Gagliardi-Florida)

**ARE WE ANY NEARER TO AN INTERNATIONAL AGREEMENT ON USE OF THE SEAS,**
Rhode Island Univ., Kingston. Graduate School of Oceanography.
J. A. Knauss.
Maritimes, Vol 18, No 4, p 4-7, November 1974. 4 p, 1 map.

Descriptors: *Conferences, *Treaties, *International law, United States, Coasts, Fish, Fish management, Fisheries, Fishing, Oil, Deep water, International waters.
Identifiers: International agreements, Coastal waters, Territorial seas(Jurisdiction), Territorial waters.

Although the recent Law of the Sea Conference in Caracas failed to produce a single paragraph of the proposed international treaty, great progress may nevertheless have been made in the ten weeks of negotiations. Because of the complexity of the issues and the wide range of interests, most nations are unprepared to formally agree on issues before receiving reasonable assurance of the nature of the agreement on all other related issues. There is nearly universal agreement on a 12-mile territorial sea. Both the U.S. and the U.S.S.R. announced in Caracas their readiness to accept, a 200-mile zone in which the coastal nation would control its economic resources, including fish and oil. At issue are the so-called residual rights, those not explicitly considered, which might become significant in the next half-century. All nations are agreed on international control, but the degree of control is at issue. If agreement is to be attained, no nation will be able to emerge from the negotiations without making substantial compromises. It is suggested that if agreement is not reached in 1975, it will be increasingly difficult to do so in succeeding years, because a number of countries, including the U.S., will move unilaterally in such areas as fishing, deep-sea mining and vessel pollution control. ervation of coastal wetlands, lying between
nd permanently submerged lands, is being im-
ented through limits on dredging, filling and
truction in these marshy areas. Regulations
oying the value of the property have been
trued as takings of property without compen-
sation, frustrating in many instances state regulatory programs. Recent cases, however, have sustained state legislative programs as protective of a valid domestic interest, constituting a valid exercise of the state's police power. Two courts that have decided the issue based their holdings on entirely different rationale. The Maryland Court of Appeals formulated a three-pronged test based upon protection of the public generally, in a reasonably necessary manner, but not unduly oppressive. The Supreme Court of Wisconsin upheld the questioned legislation on the ground that it constituted a restraint imposed to prevent public harm, and thus a noncompensable regulation. (Knocke-Florida)

**A PROPOSAL FOR THE QUANTIFICATION OF RESERVED INDIAN WATER RIGHTS,**
S. M. Campbell.
Columbia Law Review, Vol 74, No 7, p 1299-1321 (1974). 23 p, 115 ref.

Descriptors: *Indian reservations, *Water rights, *Water law, *Appropriation, *Treaties, *Water allocation(Policy), Legal aspects, Water resources development, Federal-state water rights conflicts, Water measurement, Water policy, Pueblo water rights, Water supply, Water users, Reservation doctrine, Federal jurisdiction.
Identifiers: *Water quantification, *State policy, *Indian water rights, Western states, Water scarcity.

The indefinite nature of Indian reserved rights has made state water resource planning difficult. While courts have recognized that Indian reservations have reserved water rights paramount to even non-Indian prior appropriations, there has been no attempt to quantify those rights. The leading case recognizing Indian rights referred to sufficient future requirements. The federal government has proved to be an unsatisfactory if not arbitrary, advocate of Indian interests. Fixing Indian water rights at present requirement levels with periodic review of changing needs is the best solution. The basis for allocation should be beneficial use rather than only agricultural use. The sale or lease of Indian water rights is practicable when water cannot be put to use on reservation land. The most difficult part of a quantification plan is dealing with changes in the place and nature of water use. Restricted, reasonable changes in the nature of use should be permitted when there is no unduly adverse effect on the rights of non-Indian appropriators. A periodic review of Indian needs and predictable uses can accomplish this objective. Inventory and quantification of Indian water rights should be conducted by a neutral federal body divorced from the Justice Department and the Department of the Interior. (Jenkins-Florida)

**RECOGNITION OF SUBSTANTIVE RIGHTS UNDER NEPA,**
California State Water Resources Control Board, Sacramento.
R. B. Robie.
Natural Resources Lawyer, Vol 7, No 3, p 387-437 (1974). 51 p, 249 ref.

Descriptors: *Public rights, *Water policy, *Water resources development, Federal jurisdiction, Federal government, Constitutional law, Administrative decisions, Institutional constraints, Environmental effects, Administrative agencies, Remedies.
Identifiers: *NEPA, *Private substantive rights, Standing, Burden of proof.

The most important contribution of the National Environmental Policy Act may be the encouragement of review of governmental actions, through recognition of judicially enforceable substantive rights held by the public. Section 101 of the Act, on policy, section 102 on implementation and the Council on Environmental Quality promote recognition of these rights, which arguably attain constitutional scope through the Fifth, Ninth and Fourteenth Amendments. Specifically, the right to prevent environmentally harmful federation actions may be limited by definition of the nature of the environmental right, standing, burdens of proof and difficult questions of fact. The author reviews recent case law and administrative decisions relating to possible substantive rights under the Act. (Knocke-Florida)

**INFORMATION REPORT ON THE LAW OF THE SEA: UNDERSTANDING THE DEBATE OF THE LAW OF THE OCEAN SPACE.**
The International Lawyer, Vol 8, No 4, p 688-723 (1974). 34 p, 6 ref.

Descriptors: *International waters, *Commercial fishing, *Foreign trade, *International law, Fish management, International commissions, Mineral industry, Navigation, Military aspects, Reasonable use, Continental shelf, Law of the sea.
Identifiers: *International regulatory, *International licensing.

The law of ocean space recognizes a wide variety of geopolitical and international interests and priorities. The territorial sea as an economic resource is only the beginning of a broad economic zone of interest. Support is growing for a limit of 12 miles, conditioned on free right of transit over the zone. Innocent passage, not prejudicial to peace or security of the coastal state, excludes some vessels as well as overflight rights, and an emerging concept of free transit has been proposed by the United States. High seas fishery management presently involves open access governed by regional fishery conventions and ad hoc reactions to such crises as territorial water conflicts. The United States has proposed species regulation and environmental definitions of national interests in this area. Seabed rights might best be managed by use of economic zones, international revenue sharing, pollution control, compulsory dispute settlement, and assurance of investment monies, although precise definition of Continental Shelf lands is difficult. With respect to international waters, the United States supports group international licensing, versus international agencies or regulations. Pollution control of land runoff, airborne chemicals and ocean activities is susceptible to essentially the same range of regulatory alternatives, including possible economic zone definition followed by international regulation. (Knocke-Florida)

ments, International waters, International commissions, Research and development, Treaties, Channel morphology, Flow, Flow profiles, Regimen.
Identifiers: *International agreements.

This article reviews the work done in Committee I of the Third United Nations Conference on the Law of the Sea held in Caracas in the summer of 1974. Generally, the theme of Committee efforts was the international regime and machinery for the international seabed area. This review critically analyzes the proposals presented to the Committee and the texts which it drafted. Existing differences between states on various issues which came before the Committee are identified and examined. Approaches to compromise solutions and the use of negotiators are considered. The procedure and proceedings of the Committee are outlined. Basic problems discussed include: delimitation of the international seabed area, regulation of production in the international seabed area, transfer of technology, and protection of the marine environment. The author states that there are more areas in dispute than in agreement concerning the international regime of the international seabed. He concludes that there must be more flexibility and less insistence on extreme positions at the Conference table if agreement is to be reached. (Fernandez-Florida)

Identifiers: *Water bank program.

This notice of proposed Water Bank Program amendments was published to afford interested persons an opportunity to convey their views concerning the proposed changes. The amendments redefine the Program's geographical applicability and the eligibility requirements for a farm to participate in the program. The amendments also place certain restrictions on land designated eligible for the program. All comments and suggestions regarding the proposals were to be received by the Director of the Land Use Division within thirty days after publication of the notice. (Hoffman-Florida)

**MARINE SANCTUARIES.**
National Oceanic and Atmospheric Administration, Washington, D. C.
Federal Register, Vol 39, No 125, p 23254-23257, June 27, 1974. 4 p.

Descriptors: *Administrative agencies, *Coasts, *Regulation, *Preservation, *Aquatic life, Marine animals, Marine fish, Oceans, Marine plants, Administration, Federal government, State governments, Education, Legal aspects, Management, Conservation, Control, Protection, Water law, Water management(Applied), Water policy, Water resources, Recreation, Ecology, Aesthetics.
Identifiers: *Marine sanctuaries, *Administrative regulations, *Environmental policy, *Coastal zone management, National Oceanic and Atmospheric Administration, Hazardous substances(Pollution), Territorial waters.

The National Oceanic and Atmospheric Administration hereby establishes guidelines, pursuant to Title III of the Marine Protection and Research Act of 1972, setting forth the procedure by which areas may be nominated as marine sanctuaries. These guidelines set forth the concepts, policies, and procedures for the processing of nominations and the selection, designation and operation of a marine sanctuary. Sanctuaries may be designated to preserve, restore, or enchance areas for their conservational, recreational, ecological, research, or esthetic values in coastal waters. Multiple use is provided for in each category to the extend compatible with the primary use of the sanctuary. Nomination of sanctuaries is to be effected through federal, state, or local studies. Enforcement of this regulation will be carried out by the imposition of civil penalties. Marine sanctuaries will be established to preserve, protect, and manage essential habitats, and esthetic and unique areas; to conserve certain species; or to promote scientific research, education, and recreation. **ESTUARINE SANCTUARY GRANTS--APPLICATION AND SELECTION CRITERIA PROCEDURES.**
National Oceanic and Atmospheric Administration, Rockville, Md.
Federal Register, Vol 39, No 46, p 8924-8927, March 7, 1974. 4 p.

Descriptors: *Administrative agencies, *Estuaries, *Estuarine environment, *Grants, *Coasts, Federal government, Regulation, State governments, Education, Research facilities, Aquatic habitats, Bays, Estuarine fisheries, Inlets(Waterways), Intertidal areas, Environment, Aquatic environment, Projects, Research and development, Government finance, On-site laboratories, Laboratories.
Identifiers: *Administrative regulations, *Coastal zone management, Coastal waters.

The National Oceanic and Atmospheric Administration hereby gives notice of proposed guidelines to establish policy and procedures for the nomination, selection, and management of estuarine sanctuaries as authorized under sections 312 and 314 of the Coastal Zone Management Act of 1972. These guidelines establish a program which '... provides grants to states on a matching basis to acquire, develop, and operate natural areas as estuarine sanctuaries...', for the purpose of scientific examination of ecological relationships. The primary use of estuarine sanctuaries will be to provide information essential to coastal zone management. Natural field laboratories are to be established to gather data and make studies of the natural and human processes occuring within the estuaries of the coastal zone. Zoogeographic classification will reflect differentiation and a variety of ecosystems to include all significant variations. Each individual program must interact with the overall coastal zone management program. The manner of application, criteria for selection, and method of use of the grants are delineated. **PERMITS FOR ACTIVITIES IN NAVIGABLE WATERS OR OCEAN WATERS.**
Corps of Engineers, Washington, D. C.
Federal Register, Vol 39, No 65, p 12115-12137, April 3, 1974. 23 p, 7 append.

Descriptors: *Administrative agencies, *Regulation, *Permits, *Structures, *Navigable waters, Navigable rivers, Dams, Dikes, Bridges, Bodies of water, Navigation, Legal aspects, Water law, Water permits, Water rights, Canals, Oceans, Legislation, River and Harbors Act, Federal government.
Identifiers: *Administrative regulations, *Navigational obstructions, Corps of Engineers.

The Department of the Army, acting through the Corps of Engineers, is publishing final regulations which prescribe the policies, practice, and procedures to be followed in the processing of applications for permits authorizing structures and work in or affecting navigable waters of the United States, the discharge of dredged or fill materials into navigable waters, and the transportation of dredged material for the purpose of dumping it into ocean waters. These regulations are issued pursuant to the authority of the Rivers and Harbors Act which prohibits the construction of any dams or dikes across any navigable waters in absence of approval by the Chief of Engineers and the Secretary of the Army. Activities requiring authorization are all structures of work in navigable waters except for bridges and causeways, the placement of aids to navigation by the Coast Guard, and structures constructed in artificial canals within principally residential developments. The decision whether to issue a permit will be based on an evaluation of the probable impact of the proposed structure or work and its intended use on the public interests. (Fernandez-Florida)

**INTRODUCTION OF SHORE EROSION CONTROL LEGISLATION.**
Congressional Record, Vol 119, No 9, p H307-H308 (daily ed. January 18, 1973). 2 p.

Descriptors: *Beach erosion, *Shore protection, *Soil erosion, *Great Lakes, Legislation, Washouts, Bank erosion, Recreation facilities, Government finance, Coastal engineering, Tidal effects, Waves(Water).
Identifiers: Beachfront, Welland canal.

The purpose of the proposed legislation is to provide federal assistance to protect privately-owned shore property from erosion. The bill's sponsor noted that current high water levels in the Great Lakes area, together with Canada's closing of the Welland Canal for repairs has critically aggravated this situation in his own district. He also introduce data from a report estimating the financial impact of future shore erosion on a four-mile strip with respect to private property owners and state tax revenues. The report also stated that the cost of providing necessary protection to the shorelines would be prohibitive for private owners. This legislation would provide the necessary federal financing for such a project., hopefully preventing the future loss of real property, the depletion of tax resources, and the loss of recreational areas and scenic beauty. (Hoffman-Florida)

**INTRODUCTION OF S433 (BILL FOR SAFE DRINKING WATER).**
Congressional Record, Vol 119, No 9, p S860-S864 (daily ed. January 18, 1973). 5 p.

Descriptors: *Potable water, *Water purification, *Water quality, *Public health, Domestic water, Standards, Water policy, Legislation, Grants, Governmental interrelations, State governments, Water supply, Federal government, Freshwater, Public health, Environmental sanitation.
Identifiers: *Safe Drinking Water Act, *Rural water surveys, *Water supply occupations.

This legislation was introduced to help assure high quality drinking water. The bill's sponsor noted that a recent Environmental Protection Agnecy (EPA) report showed that over 8 million people are served water which fails to meet mandatory requirements set by the federal government with respect to interestate carrier systems. The proposed bill would authorize the EPA to establish minimum federal drinking water standards prevailing maximum limits for contaminants as well as standards for the operation and maintenance of drinking water system. These standards would be enforced by the individual states, which would receive federal grants to aid in enforcement. In addition, a National Drinking Water Council would be established to give advice on scientific and engineering matters. The bill would also authorize several projects, such as the promotion of water supply occupations, the conducting of a rural water survey, and a grant program to study new water supply technology. Finally the bill would authorize citizen suits against violators of drinking water standards and against the Administrator for failing to perform mandatory duties. (Hoffman-FLorida)

Identifiers: *Implied reservation, Presidential proclamation.

An action was brought by the United States for a declaratory judgment regarding underground waters appurtenant to Devil's Hole, Death Valley National Monument. Pupfish, which have been declared a unique and endangered species, live in Devil's Hole. The district court limited the amount of water which the owners of nearby cattle ranches may withdraw. Devil's Hole was made part of a national monument by Presidential Proclamation. The government contended that the Proclamation, with its express preservation of Devil's Hole pool and the surrounding land from the public domain, contains an implied reservation of enough groundwater to assure preservation of the pupfish in that pool. The ranchers, argued that the doctrine of implied reservation of water does not apply to groundwater, but only to surface water. The court held that the doctrine of implied reservation applies to groundwater, and that the presidentail proclamation withdrawing the area from the public domain impliedly reserved rights in the groundwater sufficient to maintain the pool. Identifiers: *Environmental Impact Statment, *Injunctive relief, *National Environmental Policy Act, Environmental policy.

Environmental groups objecting to proposed Vermont highway construction sought injunctive relief against state and federal highway officials, for alleged violations of the National Environmental Policy Act (NEPA). Plaintiffs alleged procedural and usbstantive violations of NEPA, in that, the draft and final environmental impact statement (EIS) were prepared by the state agency rather than by the federal agency. On appeal the Second Circuit held that an EIS must be prepared by the responsible federal agency, and that the Federal Highway Administration must formulate and prepare its own impact statement to assess environmental effects of proposed federally-funded highway projects. The court, however, affirmed the lower court's refusal to grant an injunction based upon its discretionary power. (Fernandez-Florida)

aspects, Water law, Federal government, cities, Federal jurisdiction, Penalties(Legal), Adjudication procedure, Local governments, Lake Michigan.
Identifiers: *Information(Prosecution), *Navigation obstructions, Hazardous substances(Pollution).

An information was filed against a manufacturer and a municipal corporation for violations of Section 407 and 411 of the Rivers and Harbors Act. The Act makes it a misdemeanor to deposit'... any refuse matter of any kind or description whatever other than that flowing from streets and sewers and passing therefrom in a liquid state, into any navigable water....' The defendant discharged liquid phenolic resin from its manufacturing plant, through the sanitary district's sewer system and into Lake Michigan. The court held that the liquid phenolic resin came within the statutory prohibition, but reversed the convictions on grounds that the activity complained of came within the specific statutory exclusion of any refuse matter 'flowing from streets and sewers and passing therefrom in a liquid state.' **TRAIN V. CITY OF NEW YORK (CLASS ACTION BY CITY TO COMPEL EPA TO ALLOT FUNDS AUTHORIZED BY THE 1972 FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS).**
95 S. Ct. 839-847 (1975).

Descriptors: *Judicial decisions, *Administrative agencies, *Allotments, *Treatment facilities, *Cities, Waste treatment, Grants, Water pollution, Water treatment, Treatment, Administration, Federal government, Cost sharing, Legal aspects, Legislation, Economics, Government finance, Financing, Water Quality Act, Federal Water Pollution Control Act, New York.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Injunctive relief, Hazardous substances(Pollution), Environmental policy, Class action suits.

A class action was brought by the City of New York against the Administrator of the Environmental Protection Agency (EPA) to compel allotment of funds which were appropriated under the authority of the 1972 Amendments of the Federal Water Pollution Control Act. Title II of these Amendments makes available federal financial assistance for municipal sewers and sewage treatment works. Section 207 authorizes the appropriation of 'not to exceed' specified amounts for each of three fiscal years, and section 205(a) provides that the 'sums authorized to be appropriated pursuant to section 207... shall be alloted by the Administrator' of the Environmental Protection Agency. In compliance with a Presidential Directive, the Administrator refused to allot the maximum allowable amounts. The issue was whether the 1972 Act permits the Administrator to allot to the States under section 205 less than the entire amounts authorized to be appropriated by section 207. The Supreme Court held that the Act required the allotment of all sums authorized to be appropriated, and that the administrator was not authorized to allot lesser sums in his discretion. (Fernandez-Florida)
W75-12284

**TRAIN V. CAMPAIGN CLEAN WATER, INC. (ACTION BY ENVIRONMENTAL GROUP TO REQUIRE EPA TO RELEASE FUNDS AUTHORIZED FOR FEDERAL GRANTS TO MUNICIPALITIES FOR WATER POLLUTION CONTROL.**
95 S. Ct. 847-848 (2975).

Descriptors: *Judicial decisions, *Administrative agencies, *Grants, *Treatment facilities, *Cities, Waste treatment, Water pollution, Water treatment, Treatment, Administration, Federal government, State government, Cost sharing, Legal aspects, Legislation, Economics, Government finance, Financing, Water Quality Act, Federal Water Pollution Control Act, Allotments.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Hazardous substances(Pollution), *Injunctive relief, Administrative regulations, Environmental policy.

An environmental group brought an action against the Administrator of the Environmental Protection Agency challenging the Administrator's action in withholding from the states 55 per cent of a fund authorized by Congress under the Federal Water Pollution Control Act (FWPCA), for federal grants to municipalities for construction of publicly-owned waste treatment works. The Supreme Court held that the Administrator did not have discretion to allot to the states less than all sums authorized to be appropriated under the FWPCA Amendments of 1972. (Fernandez-Florida)

**WETZEL V. A. DUDA AND SONS (ACTION BY RIPARIAN PROPERTY OWNERS TO ENJOIN WATER POLLUTION TO LAKE FROM FARMING OPERATIONS).**
306 So. 2d 533-534 (4th D.C.A. Fla. 1975).

Descriptors: *Trespass, *Judicial decisions, *Water pollution, *Lakes, *Farm wastes, Common law, Legal aspects, Riparian rights, Equity, Land tenure, Water law, Water pollution sources, Florida, Riparian land, Wastes, Farms, Chemical wastes, Agricultural chemicals, Chemicals.
Identifiers: *Injunctive relief, *Intentional torts, *Nuisance(Legal aspects), Hazardous substances(Pollution), Non-point sources(Pollution).

Plaintiffs, riparian property owners on a lake, brought an action against a nearby farming operation for an injunction to abate water pollution and for damages. Defendants were polluting the lake by discharging noxious chemical and other substances from a nearby farming operation. Plaintiffs alleged that their riparian rights were injured by the defendant's creation of a nuisance, that defendents breached their duty to conduct their farming operation in such a manner as not to injure plaintiffs, that the defendants were engaging in a continuing trespass, and that the actions of the defendants were willful and malicious. The trail court dismissed the action for failure to exhaust their administrative remedies under the Environmental Protection Act. The Fourth District Court of Appeal of Florida reversed and remanded holding that the action was predicated on the right to abate nuisance, continuing trespass, and continuing breach of duty; therefore, the property owners were not required to exhaust administrative remedies before seeking injunctive relief. (Fernandez-Florida)
W75-12286

**COLORADO PUBLIC INTEREST RESEARCH GROUP, INC. V. TRAIN (CITIZEN SUIT TO COMPEL THE ENVIRONMENTAL PROTECTION AGENCY TO CONTROL DISCHARGE OR RADIOACTIVE MATERIALS INTO NAVIGABLE WATERS).**
507 F. 2d 743-749 (10th Cir. 1974).

Descriptors: *Radioactive wastes, *Colorado, *Water pollution control, *Federal Water Pollution Control Act, Regulation, Permits, Water pollution sources, Pollutant identification, Impaired water quality, Federal project policy, Federal jurisdiction, Administrative agencies, Navigable waters.
Identifiers: *Administrative accountability.

Plaintiff, a nonprofit Colorado Corporation, sought to compel the Administrator of the United States Environmental Protection Agency to control discharges of radioactive materials into navigable waters. The Administrator claimed that by-products were not radioactive pollutants under law, and refused to regulate discharges into Colorado waters. Relying on the principle that a clear and reasonably certain statute requires no additional rule of construction, and noting that the Federal Water Pollution Control Act requires the Administrator to control pollutants, including radioactive materials, the United States Court of Appeals, Tenth Circuit, reversed and remanded the summary judgment in favor of defendants rendered by the District Court. (Knocke-Florida)
W75-12287

**SUBMERGED LANDS (STATE TITLE TO CERTAIN SUBMERGED LANDS).**
Illinois Stat. Ann. Ch 19, secs. 150 thru 151 (Smith-Hurd 1972). 1 p.

Descriptors: *Illinois, *Land reclamation, *Ownership of beds, *Beds under water, *Penalties(Legal), Regulation, Legislation, Public lands.
Identifiers: *Submerged lands, *Reclaimed land.

Under sections 150 and 151 the State of Illinois asserts the right to reclaim title to land in the state now submerged, and land that was formerly submerged, but which has since been illegally filled in, reclaimed and occupied. To enforce the State's claim, the Attorney General is authorized to bring suit to recover the lands, or to protect such lands from illegal occupation. (Hoffman-Florida)

**BORGMANN V. FLORISSANT DEVELOPMENT CO (ACTION TO ENJOIN ADJOINING PROPERTY OWNERS FROM COLLECTING AND DISCHARGING SURFACE WATER ONTO PLAINTIFFS' LAND).**
515 S. W. 2d 189-197 (Mo. Ct. App. 1974).

Descriptors: *Riparian land, *Riparian rights, *Natural flow doctrine, *Adjacent landowners, *Judicial decisions, Legal aspects, Common law, Equity, Land tenure, Negligence, Water law, Water rights, Relative rights, Competing uses, Water transfer, Natural flow, Channel flow, Flow, Streamflow, Regulated flow, Alteration of flow, Diversion, Obstruction to flow.
Identifiers: *Common enemy rule, *Injunctive relief, Nuisance(Legal aspects).

Plaintiff, landowners sued to enjoin adjoining property owners from collecting and discharging surface water onto plaintiffs' land. The issue presented was whether a landowner may develop a tract of land by building an apartment complex and collect surface water into a weir located on his property and permit the overflow to be discharged onto the adjoining tract of land. Plaintiffs contended that defendants constructed the system of storm sewers in a manner changing the flow of surface waters from the natural water course' and have discharge large quantities of surface water onto plaintiffs' lands where no natural water course existed prior to the construction. The court held that if the conformation of the land gives the surface water flowing from one tract to the other a fixed and determining course, so as to uniformly discharge it upon the servient tract at a fixed and definite point, the course thus uniformly followed by the water in its flow is a 'watercourse'. In denying the injunction, the court further held that defendant's discharge of water onto plaintiffs' land was through a 'natural surface water drainway or channel' and thus permissible under the common enemy doctrine. (Fernandez-Florida)

**DITY, UNDER FEDERAL CONSTITU- OF STATE STATUTE OR LOCAL OR- NCE REGULATING PHOSPHATE CON- OF DETERMENTS,**
Myers.
R Fed. 365-375 (1974). 11 p, 6 ref.

ptors: *Local governments, *Phosphates, r pollution sources, *Constitutional law, ial decisions, Water quality control, hication, Florida, Illinois, Chicago, Indus- Environmental control, Legislation.
iers: State policy, Hazardous sub- s(Pollution), Phosphate, Regulation, Com- merce clause, Chicago ordinance, Ordinances, Statutes.

The annotation deals with constitutional challenges to state and local statutes regulating the phosphate content of detergents. Most of the litigation involves suits by the Soap and Detergent Association for a preliminary injunction against enforcement of a statute. The courts are divided on the issue of whether the statute or ordinance constitutes an undue burden on commerce. Employing a balancing test, more courts have upheld such laws where the only burden on interstate commerce is increased cost to the businessman. A Chicago ordinance making it a criminal offense to sell detergent containing phosphates was held to constitute an undue burden on commerce because the product was not sufficiently harmful to justify disruption of the flow of interstate commerce. Challenges based on substantive due process and equal protection grounds have not succeeded thus far in the federal district courts. (Jenkins-Florida)
W75-12293

**UNITED STATES V. ASHLAND OIL AND TRANSPORTATION CO. (APPEAL FROM FINDING THAT DEFENDANT HAD VIOLATED FWPCA AMENDMENTS OF 1972 BY DISCHARGING OIL INTO NAVIGABLE STREAM).**
504 F.2d 1317-1330 (6th Cir. 1974).

Descriptors: *Federal Water Pollution Control Act, *Water pollution, *Water pollution control, *Water pollution sources, *Oil pollution, *Oil spills, Water, Water quality, Water quality control, Pollutants, Pollutant identification, Oil, Streams, Navigable waters, Tributaries, Rivers, Navigable rivers.
Identifiers: Evidence, Hazardous substances(Pollution).

Corporate defendant was charged under the Federal Water Pollution Control Act of 1972 with failing to immediately notify an appropriate federal agency after ascertaining that it had discharged oil into a non-navigable stream. The United States District Court for the Western District of Kentucky entered a guilty verdict from which defendants appealed. The Sixth Circuit affirmed and held that the Act was intended to control both discharges of pollutants directly into navigable waters and discharges of pollutants into non-navigable tributaries which flow into navigable waters. The court also found that Congress has the constitutional authority under its interstate commerce powers to prohibit the discharge of pollutants into non-navigable tributaries of navigable streams. The court noted that the government is not required to bear the burden of proof to establish that pollutants were not only discharged into a non-navigable tributary of a navigable river, but also that reached and polluted the navigable river. (Gagliardi-Florida)

**TARSHIS V. LAHAINA INVESTMENT CORP. (RESPONSIBILITY OF OWNER OF BEACH FRONT PROPERTY TO WARN OF SURGING WAVE).**
400 F.2d 1019-1021 (9th Cir. 1973).

Descriptors: *Judicial decisions, *Hawaii, *Waves, *Turbulence, *Surf, *Negligence, Ocean waves, Rip currents, Third party effects, Local aspects, Penalties(Legal).
Identifiers: *Tort liability, *Beach front hotels.

Plaintiff brought a tort action against an ocean-front hotel for personal injuries suffered as a result of being thrown on the beach by a wave. The plaintiff alleged negligence by the hotel in not warning its guests of the existence of the powerful, surging surf. An appeal was taken following a summary judgment of dismissal. In reversing the trial court, the Court of Appeals found that whether the ocean would have appeared dangerous to an ordinarily intelligent person was question of fact inappropriate for summary adjudication. The case was remanded to allow the plaintiff to present her theory that the surf represented an unapparent, dangerous condition of which the hotel operator negligently failed to warn its guests. (Hoffman-Florida)

**WATER SUPPLY.**
New York Session Laws, Ch. 664, sec. 15-1501 through 1529 (McKinnley 1972).

Descriptors: *Well regulations, *New York, *Reservoirs, *Reservoir construction, *Reservoir sites, *Water supply, *Dependable supply, Reservoir operation, Water management, Water utilization, Legislation, Pipelines.
Identifiers: *Forest preserve reservoirs, *Water supply construction, *Legal damages.

The statute contains regulations concerning the installation of new sources of water supply. All maps and plans for new or additional sources of water supply or for public forest preserve reservoir projects are to be submitted for approval to the appropriate state department. The information required on the application is set forth in detail. Restrictions are placed on the transportation of freshwater from New York to neighboring states. Guidelines for the approval of reservoir projects are set forth. Also designated is supervision of construction, responsibility for future repairs, and holder of title to the reservoir. The statute also establishes requirements for obtaining permission to drill wells in Long Island, and provides for the payment of damages to any third person injured by the execution of any water supply project carried on by the City of Rochester. (Hoffman-Florida)

**CITY OF LAKE CHARLES; RECLAMATION AND DEVELOPMENT OF LAKE FRONT.**
Louisiana Constitution, Article 14, sec. 39 (Supp. 1973).

Descriptors: *Louisiana, *Land reclamation, *Land development, *Land management, *Levees, Public lands, Legislation, Land tenure, Economics, Breakwaters, Retaining walls, Eminent domain, Cities, Local governments, State governments.
Identifiers: *Lakefront development, *Beach development.

The Louisiana Constitution authorizes the City of Lake Charles to have full and exclusive right and power to provide various works, of a non-commercial non-profit nature, necessary for the reclamation and development of the lake front. The section describes the particular area of Lake Charles and the adjoining property over which the City will have control. The City of Lake Charles is also authorized to acquire any private property along the shore of the lake, within the defined

limits necessary for the reclamation project. To help defray costs, the State grants title to the city of all public property necessary to further the goals of the project. The State is prohibited from authorizing any governmental subdivision, private entity or person to reclaim the bed of the lake or constructing any works within the limits described. Finally, the City of Lake Charles is authorized to issue bonds and incur additional debt of up to $3 million to finance the public improvements authorized. (Hoffman-Florida)

**UNITED STATES V. 187.40 ACRES OF LAND, HUNTINGDON COUNTY, PA. (ACTION TO CONDEMN LAND FOR USE IN CONSTRUCTING FLOOD CONTROL PROJECT).**
381 F. Supp. 54 (M.D. Pa. 1974).

Descriptors: *Condemnation, *Flood control, *Reservoir construction, Pennsylvania, Rivers, Flood protection, Condemnation value, Flooding, Floods, Reservoir sites, Reservoirs, Eminent domain.
Identifiers: Presumptions(Legal).

This case arises from condemnation proceedings instituted by the Secretary of the Army for the construction of a flood control reservoir on the Juniata River, Huntingdon County, Pennsylvania. The United States moved to strike the landowners' defense that the Secretary of the Army lacked statutory authority to take the land and that their land was not necessary to the success of the project. The United States District Court for the Middle District of Pennsylvania held that the Secretary had authority to take the property even though the property was not listed in the plan submitted to Congress. The court found that the judicial role in reviewing condemnation cases does not encompass the power to determine whether the land taken is actually necessary for the successful operation of the project, but only extends to deciding the propriety of the public purpose of such acquisitions and the requisite statutory authority. **LIAISON WITH PLANNING AUTHORITIES-A VITAL LINK,**
R. Satchell.
Water, No 3, p 9-11, April, 1975. 1 fig.

Descriptors: *Water policy, *Water supply, *Legislation, *Administration, Comprehensive planning, Decision making.
Identifiers: Water authorities, Great Britain.

The need for cooperation between water authorities and local planning agencies is essential to providing proper water services. This need was recognized by Section 24(8) of the Water Act 1973 making it necessary for water authorities to take development plans, local plans, and structure plans into account and consult with local authorities. The Severn Trent Water Authority arranges a meeting about once a year with the county officials, regional economic planning councils, managers of new towns, and the central and regional Department of Environment. Planning applications are part of the on-going responsibilities of the water authority which are passed on to the proper division to get their opinions on the appropriate water reclamation and supply. The water authority must keep the counties and districts informed of the intent and content of their short and medium term programs. Although the water authority should contribute to the planning process it is not their purpose to usurp the function of local planners. (Dean-FIRL)

## 6F. Nonstructural Alternatives

**FLOOD INSURANCE AND FLOOD PLAIN ZONING AS COMPATIBLE COMPONENTS,**
Clark Univ., Worcester, Mass. Dept. of Geography.
A. L. Marcus, and G. H. Abrams.
Natural Resources Lawyer, Vol 7, No 4, p 481-619 (1974). 29 p, 112 ref, 4 fig.

Descriptors: *Flood plain insurance, *Flood plain zoning, *Flood damage, *Flood protection, *Flood plains, Nonstructural alternatives, Legal aspects, Water zoning, Zoning, Flood routing, Economics, Insurance, Floodways, Overflow, Flood control, Floods, Flood data, Flood flow, Flood forecasting, Flash floods, Multiple-purpose projects, Alternative planning.
Identifiers: *Flood damage reduction, Compatible component approach.

An examination is made of the utilization of flood insurance as an element in a multiple alternative planning objective for flood plain regulation. Physical, human, and legal aspects of the problem are explained in relation to decision-making policies. Initially, the article describes the physical setting which leads to the occurrence of floods. An explanation of the interplay between river hydrology and numerous meteorological stimuli is presented. Further, the authors consider human encroachment on flood plains as one of the primary causes of flood losses. Two factors are emphasized as significantly contributing to flooding: large developed areas which have caused an increase in initial runoff, and the rise in elevation of flood waters as a result of man-made obstructions. The article presents the ramifications of flood insurance in great detail, describing its benefits in effecting a comprehensive flood protection program. Constitutional issues of due process, equal protection, and taking of property without compensation are discussed. The authors conclude that flood insurace is a viable component for a program to help relieve flood-induced tragedy. (Fernandez-Florida)
W75-12227

**FLOOD PLAIN INFORMATION: ELLICOTT CREEK IN THE TOWNS OF LANCASTER AND ALDEN AND THE VILLAGE OF ALDEN, ERIE COUNTY, NEW YORK.**
Army Engineer District, Buffalo, N.Y.
Prepared for New York State Department of Environmental Conservation, Division of Water Resources, October, 1972. 56 p, 24 fig, 9 plates, 10 tab.

Descriptors: *Floods, *Flooding, *Flood plains, *Flood protection, *Flood damage, *Flood plain zoning, Maximum probable flood, Obstructions to flow, *New York.
Identifiers: Lancaster(NY), Alden(NY), Erie County(NY), *Ellicott Creek(NY), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

The reach of Ellicott Creek covered in this report lies within the Town of Lancaster and the Town and Village of Alden, New York, a total length of 13.8 miles. Flood records are incomplete but research showed the greatest flood was in 1936 (estimated 50-year frequency). Other major floods occurred in 1916, 1929, 1937, 1959 and 1963. Melting snow coincident with moderate amounts of precipitation has often caused major damaging floods in late winter or early spring although large floods occur at all times of the year. Development in the flood plain has been substantial and will continue to increase due to increased suburbanization in the Buffalo area; population in the basin has increased from 19,000 in 1920 to 153,000 in 1970. Floods of any major proportion could cause substantial damage due to residential and commercial development in the flood plain, high channel velocities, and obstructions in the channel of vegetation. The Alden sewage disposal plant would be damaged, creating health problems. At stoney Road Bridge an Intermediate Regional Flood would have a peak discharge of 6,350 cfs and the Standard Project Flood discharge would be 23,800 cfs. No specific regulations for land use with respect to flood risk are in effect in these towns. Channel improvements, levees and a reservoir are included in possible flood control measures under consideration. Suggestions for flood plain management include encroachment lines, zoning, subdivision regulations, building codes, and flood plain regulations. (Park-North Carolina)

OUTPUT ANALYSIS AND THE EN-
MENT,
ity Coll. of Wales, Aberystwyth. Dept. of
ics.
athur.
npton University, Department of
ics, Environmental Economics Study
Bibliography Series 14, 1973. 6 p, 18 ref.

tors: *Economic impact, *Bibliographies,
output analysis, *Mathematical models,
on abatement, Social impact, Industrial
ion, Leontief models.
ers: *Isgard models.

Input-output analysis, as a tool for the study of pollution abatement, is presented with an introduction to its mathematics and an annotated bibliography. The mathematics of input-output analysis can be described in terms of (1) a partitioned matrix with component matrices of coefficients of input-output, pollution generation, goods required for eliminating pollutants, and pollution production and of total factor costs of both economic activities and pollution control activities; and (2) output, cost, and price vectors. Included in the bibliography are the 3 books and 15 articles published from 1966 to 1974. The topics range from a simple introduction to a summary of previous theoretical work to an application of input-output analysis to Canadian industry. Empirical results as well as theoretical results are presented in the articles covering the effect of pollution control in U.K. prices, the Leontief models, the Isgard model, and other applications of input-out analysis. **BIG CYPRESS NATIONAL PRESERVE (PART 1).**
Hearings--Subcomm. on Parks and Recreation--Comm. on Interior and Insular Affairs, U. S. Senate, 93d Cong, 2d Sess, March 21 and 22, 1974. 369 p, 1 map, multiple photo, multiple illus.

Descriptors: *Florida, *Swamps, Parks, Recreation, Ecology, Water, Ecosystems, Land, Slopes, Sheet flow, Water levels, Rainfall, Watershed management, Drainage, Drainage effects, Drainage patterns (Geologic).
Identifiers: Congressional hearings.

The Senate Subcommittee on Parks and Recreation convened on March 21, 1974 to consider S.334, S.783, S.920 and H. R. 10088. All four measures involve protection for the Everglades-Big Cypress ecology. The bills differ in the methods of acquisition and slightly different acreage in the acquisition and establishment plans. A vital factor in the Big Cypress ecosystem is the slope of the land, which results in exceedingly slow drainage which extends the wet months beyond the period of actual rainfall. The underneath flatness causes sheet flows, the result of which is water level changes of only a few inches which can affect thousands of acres. Much of those acres stand under water for as long as four months after the rainfall ceases. This is a natural watershed storage area and supplements the manmade areas. Although acquisition will be expensive, a monumental commitment in terms of funds for environment protection may be necessary since future action will probably be even more expensive. **THE FIFTH ANNUAL REPORT OF THE COUNCIL ON ENVIRONMENTAL QUALITY.**
Council on Environmental Quality, Washington, D. C.
For sale by the Superintendent of Documents, Government Printing Office, Washington, DC, for $5.20. 1974, 636 p, 57 fig, 1 illus, 76 photo, 86 tab, 12 append.

Descriptors: *Administrative agencies, *Environmental effects, *Environmental control, *Environmental engineering, Air pollution, Water pollution, Land use, Land development, Land management, Land resources, Programs, Administration, Federal Government, Regulation, Comprehensive planning, Legal aspects, Planning, Social aspects, Water resources development, Statistics, Legislation, United Nations.
Identifiers: *Environmental policy, *National Environmental Policy Act, Energy crisis, Hazardous substances (Pollution), Non-print sources (Pollution).

This Fifth Annual Report of the Council on Environmental Quality was prepared in accordance with the National Environmental Policy Act of 1969 (NEPA), which requires the Council to report at least once a year on the state of the environment and efforts to improve it. An overview of current knowledge about a number of land use issues is presented. Topics include: the environmental, economic, and social impacts of land development; the various stimulants which affect develop-

ment; and the different tools available to control the pace and character of development. Major developments during the past year in government programs to protect the environment are considered. Information about the condition of the enviroment, important trends in environmental quality, and basic environmental statistical data is provided in the Report. One chapter reviews the evolution of the National Environmental Policy Act over its first five years, including the adoption of environmental impact statement requirements by the states and foreign countries. The report describes the development of the United Nations Environmental Program, and, in the framework of its Action Plan, the broad range of international environmental efforts now underway around the globe. The final chapter provides brief descriptions of some of the Council's analytical work over the past year. (Fernandez-Florida)

**USES OF SCIENTIFIC INFORMATION IN ENVIRONMENTAL DECISION-MAKING,**
Indiana Univ., Bloomington, School of Law.
M. R. Gelpe, and A. D. Tarlock.
Southern California Law Review, Vol 48, No 2, p 371-427, 1974. 57 p, 145 ref.

Descriptors: *Legal aspects, *Public rights, *Water law, *Competing uses, *Cost-benefit analysis, Costs, Economics, Benefits, Environmental effects, Common law, Constitutional law, Equity, Judicial decisions, Regulation, Third party effects, Social aspects, Water rights, *Adjudication procedure, Legislation, Public health, Environment, Cost-benefit theory, Technology, Natural resources, Risks.
Identifiers: *Proximate causation, *Environmental policy, *Hazardous substances (Pollution), Injuctive relief, Standing(Legal).

The response of the legal system to the uncertainty inherent in scientific analysis of environmental impacts is explored. The authors argue that existing concepts of cause-in-fact, the foundation of legal liability, place potentially severe constraints on the ability of the legal system to respond to the need to minimize the risks of future environmental injury. Both the legal and scientific concepts of cause are explained and distinguished. The article points out the concern of science to describe physical relationships and draw inferences from observed to unobserved behavior, while the law treats an event as having happened or likely to occur regardless of what did in fact happen or may occur. In addition, the article discusses the less of what did in fact happen or may occur. In addition, the article discusses the decision-making process with respect to how much of an activity should be allowed or if a project should be prohibited or modified as one aspect of the broader problem of technology assessment. The relationship between the problems studied by the science of ecology and the difficult problems of value choice faced by decisionmakers forced to choose between alternative uses of natural resources is explored. In conclusion, the article proposes a refinement of the concepts of cause and injury, to conform them to real threats to the environment, by means of risk-benefit analysis consistent with principles of fairness. (Fernandez-Florida)
W75-12204

**THE DOCTRINE OF PRIMARY JURISDICTION MISCONCEIVED: END TO COMMON LAW ENVIRONMENTAL PROTECTION,**
Florida Attorney General's Office, Tallahassee.
K. F. Hoffman.
Florida State University Law Review, Vol 2, No 3, p 491-510, 1974, 20 p, 110 ref.

Descriptors: *Administrative agencies, *Administrative decisions, *Jurisdiction, *Judicial decisions, *Pollution abatement, Common law, Equity, Public health, Public rights, State governments, Administration, Water law, Legal aspects, Adjudication procedure, Administration, Federal government, Legal review, Water pollution, Abatement, Control, Water pollution control, Water pollution sources.
Identifiers: *Hazardous substances (Pollution), *Injunctive relief, *Nuisance (Legal aspects).

The doctrine of 'primary jurisdiction' was articulated by the United States Supreme Court in 1907. The doctrine bars access to the courts where a dispute should be heard first in an administrative tribunal, for purposes of uniformity or to make use of particular administrative expertise. This article examines the effect of the primary jurisdiction doctrine on common law actions to abate pollution-caused nuisances. Both the history and limitations of the doctrine are reviewed. Historically, government possessed the authority and duty to seek abatement of nuisances that threatened public health and welfare; and courts of equity have had concurrent jurisdiction. This article illustrates how the doctrine of primary jurisdiction destroys that traditional authority and replaces it with administrative control. Most commentators agree, states the author, that these agencies are very unsatisfactory substitutes because they are unresponsibe to public needs. The article concludes that the creation of the doctrine was an improper judicial attempt to legislate which has resulted in irreparable injury to the public health and welfare by delaying access to the courts until it is too late to remedy the effects of uncontrolled pollution. (Fernandez-Florida)
W75-12206

**THE FLORIDA ENVIRONMENTAL PROTECTION ACT OF 1971: THE CITIZEN'S ROLE IN ENVIRONMENTAL MANAGEMENT,**
P. A. Renovitch.
Florida State University Law Review, Vol 2, No 4, p 736-765, 1974. 30 p, 181 ref.

Descriptors: *Legal aspects, *Judicial decisions, *Public rights, *Legislation, *Environmental effects, Public health, Administrative agencies, Common law, Equity, Regulation, Water law, Administration, Adjudication procedure, State Governments, Administrative decisions, Environment, Environmental control, Environmental engineering, Management, Florida.
Identifiers: *Administrative regulations, *Class action suits, *Liability (Legal aspects), *Nuisance (Legal aspects), *Standing (Legal), Environmental policy, Hazardous substances (Pollution), Injunctive relief.

In response to increased public awareness of visible environmental decay, the Florida Legislature has enacted legislation designed to forestall environmental deterioration. The reluctance of administrative agencies to enforce the law, however, has impaired the ability of concerned citizens to protect the environment. This note discusses the inadequacies of the common law nuisance remedy in environmental litigation. The author discusses the strict standing requirements of the 'special injury' rule which inhibits the institution of public nuisance actions by private citizens. Particular emphasis is given to the granting of standing by Florida's Environmental Protection Act, and to its potential effecacy as a means of providing access to the courts, which frequently have been foreclosed by traditional public nuisance doctrine. The author criticizes the traditional practice of placing the enforcement of environmental laws in the hands of administrative agencies, and strongly endorses the Environmental Protection Act as affording citizens a voice in environmental management. In conclusion, the author suggests that judicial intervention in the environmental regulatory scheme should insure effective and efficient enforcement of environmental laws. (Fernandez-Florida)

Descriptors: *Dams, *Cost allocation, *Cost analysis, *Cost-benefit analysis, *Cost-benefit ratio, *Cost-benefit theory, Costs, Economics, Economic justification, Economic impact, Economic prediction, Inflation(Economic), Environment, Environmental control, Water, *California, Flood control, Irrigation, Recreation, Fish, Wildlife, Environmental effects.
Identifiers: Administrative regulations, New Melones Dam(Calif).

The degree to which economic factors are arranged in a light favorable to environmental projects has become a concern to the General Accounting Office (GAO). The New Melones Dam in California has been singled out to determine how economic assessments fall short of the objectivity which by law they are required to display. Calculations of the authors show vast exaggeration of the benefit-to-cost ratio resulting from the evaluation techniques used by the Corps of Engineers. The following project benefits were found to have been overstated: flood control, irrigation, power, recreation, fish and wildlife, and water quality control. Some of the errors pointed out are substantial, some in themselves enough to make the project uneconomical. Others are not as substantial but, in combination have the same effect. In addition, the Corps utilized a project life of 100 years rather than the more recognized 50 year life. Further, it did not use the correct interest rate or consider many environmental costs. In light of these errors, it was recommended the construction of the New Melones Dam be forestalled until a re-evaluation of the benefit-cost analysis be done. (Gagliardi-Florida)

HISTORICAL AND LEGAL ASPECTS OF NEPA,
G. Noble.
Water and Sewage Works, Vol 122, No 5, p 86-88, May, 1975. 8 ref.

Descriptors: *Legislation, *Water pollution control, Legal aspects, Environmental effects.
Identifiers: *National Environmental Policy Act(NEPA), Environmental impact statements.

The National Environmental Policy Act (NEPA) was signed into law on January 1, 1970. The historical and legal aspects of NEPA are discussed. Although the original act was really only a statement of good intention, its action forcing provisions stated that: a systematic interdisciplinary approach will be used by the agencies to insure integrated use of the natural and social sciences and the environmental design arts; and, methods will be developed to give appropriate consideration in decision making to presently unquantified environmental amenities. The main feature of the Act is the provision that requires each Federal agency to submit a statement of environmental impact in advance of each major action, recommendation or report on legislation that may significantly affect the quality of the human environment. Areas of uncertainty, such as what projects are "significant" enough to require an impact statement and what degree of latitude should exist between agency interpretations, exist under NEPA. The results of several court cases which have helped to clarify the interpretation of NEPA are presented. (Orr-FIRL)

Journal of Hydrology, Vol 18, No 3-4, p 243-255, March, 1973. 3 fig, 5 ref.

Descriptors: *Rain gages, *Rainfall, Distribution patterns, Equations, Analytical techniques, Estimating, Areal.
Identifiers: Errors.

Analytical expressions for the error in the area-averaged rainfall as estimated by a network of rain gages and the fluctuations in the estimate have been derived. The actual variance of the area-averaged rainfall in terms of the mean, the mean square, and the space autocorrelation function of the areal distribution of rainfall also has been examined. The error equation is evaluated for an exponential autocorrelation function and a simple approximate expression is obtained. (Sandoski-FIRL)

MEASUREMENT OF EXTREMELY SMALL PRESSURE DIFFERENCES IN WATER,
Cambridge Univ. (England). Dept. of Applied Mathematics and Theoretical Physics.
D. Weihs, and M. Sumer.
Journal of Physics E: Scientific Instruments, Vol. 6, No. 1, p 77-78, January, 1973. 3 fig, 3 ref.

Descriptors: *Measurement, *Manometers, Pressure, *Pressure measuring instruments.
Identifiers: Water velocities.

A technique for measuring small pressure differences in water, corresponding to water velocities of down to 0.04 meters per second has been developed. The system is a modification of Preston's twin reservoir techinque, using an inclined U tube manometer. Results accurate within one percent were achieved by this system,

which has a slightly faster response time than former techniques, in addition to being simpler in construction. (Sandoski-FIRL)

J. Karl, and H. Toldrian.
Wasser und Boden, No 3, p 63-65, 1973. 2 fig, 8 ref.

Descriptors: *Analytical techniques, *Rainfall-runoff relationships, *Soil erosion, *Infiltration, Rain gages, Measurement.
Identifiers: Ground infiltration.

A mobile irrigation unit, designed for measurement of rainfall-runoff, soil erosion, and ground infiltration, can be used almost anywhere. The unit, carried on a Volkswagen bus with trailer, has 22 nozzles emitting water at a maximum of 99 mm/h. Water can be pumped from a source nearby, or transported in the bus. The precipitation is measured with 15 Hillmann rain gages on the ground and the volume of water used is checked with a water meter installed between the pump and the nozzles. The area sprinkled, 0.25 meters, is bordered off by metal sheets dug into the ground or by ditches stabilized with a holding preparation. The collecting system consists of inclined metal sheets adjoining large metal funnels with trap spaces for eroded soil and an outlet for water. Water is collected into calibrated fiber metal tubes and seepage is measured with two weight-gage cylinders staked in the ground. The work includes determinations of the ground profile and features, and soil analysis. (Holz-FIRL)

## 7C. Evaluation, Processing and Publication

**NEW COMPUTER SYSTEM MONITORS BATON ROUGE SEWERS.**
Water and Sewage Works, Vol. 120, No. 4, p 57, April, 1973.

Descriptors: *Computers, *Monitoring, *Sewerage, Maintenance costs, Pumping plants, Maintenance, Data collections, Data transmissions, *Pollutant identification, Waste water treatment, Louisiana, Remote reusing.
Identifiers: Baton Rouge (La), Sensors, Remote Contact Monitor Program.

A new computer system that is helping Baton Rouge, Louisiana, monitor the condition of its sewer system on a 24-hour basis is cutting maintenance costs by more than $20,000 a year. Using an automatic telephone dialing units, the IBM system/7 computer places calls to telephone unit which relay tone patterns generated by sensors attached to 120 unmanned sewerage pumping stations throughout the city. If the tone pattern indicates that a malfunction has occurred, the computer identifies the irregular response and the type of malfunction and prints a message to an operator telling him precisely what is wrong at which station. This 'Remote Contact Monitor Program' enables the computer to monitor the status of up to six contact-point sensors at any location with the proper telephone signaling equipment. (Sandoski-FIRL)

**COMPUTER'S MASTER PLAN SIGNALS SEWER PROBLEMS BEFORE THEY START,**
Thousand Oaks Utilities Dept., Calif.
O. H. Blume, and P. B. Kline.
The American City, Vol. 88, No. 5, p 96, 144, May, 1973.

Descriptors: *Computers, *Sewerage, *Model studies, Sewers, Flood forecasting, Interceptor sewers, Peak discharge, Design, Construction, Costs, California, *Pollutant identification.
Identifiers: Arcadia(Calif).

Engineering Science, Inc. (E-S) of Arcadia, California, has prepared a computerized sewerage system master plan to predict sewer overloading and flooding, thus enabling the city to take preventive action. In developing the master plan, E-S and city personnel first determined the capacity of the existing sewerage system. They superimposed on this system patterns of anticipated growth. The computer calculated, sized, and prepared estimated costs of new or supplemental collection and interceptor sewers. The growth patterns included presently approved development, two other logical phases of growth, and the predicted ultimate growth patterns. The program consists of a design model and a cost model. Each can be manipulated easily to simulate any condition of development. Program output includes calculated peak flows and velocity, capacity of existing sewers, size, length, and cover, and invert elevations of recommended new sewers if required. After helping

n the sewers, the cost model estimates con-
ion costs. The master plan program can
ze up to 800 separate reaches of sewer. It is
n in FORTRAN extended language. The pro-
is flexible and can be modified at nominal
It takes about 30 seconds to run the entire
am and costs less than $40. (Sandoski-FIRL)

, March, 1973. 3 fig, 3 ref.

riptors: *Hydrologic aspects, *Floods, Rain-
unoff relationships, Hydrographs.
ifiers: Statistical studies.

67 a report from the Institution of Civil En-
rs drew attention to the need to updates a
publication on reservoir flooding in light of
quent improvements of techniques in flood
ology. A team of hydrologists started a three-
investigation, due for completion in 1973, to
ine various aspects of the mag-
e/frequency problem associated with flood
ology using two approaches. One is a statisti-
tudy of instantaneous peak flows and the
is concerned with catchment response and is
ore a study of particular rainfall-runoff
s. This second approach has required the col-
n and processing of a considerable quantity
od event data. Antecedent condition, storm
ll, and flow hydrograph data have been as-
led for over 1500 events from 151
ments. (Sandoski-FIRL)

basic-data report for the 1973 water year
1, 1972-Sept. 30, 1973) for California in-
s records of chemical, physical, and biologi-
haracteristics of surface and groundwater.
e data were collected from designated sam-
sites at predetermined intervals such as once
, weekly, monthly, or less frequently, and at
sites data were recorded on punched paper
at 15-, 30-, or 60- minute intervals. Chemical
y includes concentrations of individual dis-
d constituents and certain properties or
cteristics such as hardness, sodium adsorp-
ratio, specific conductance, and pH. The
gical information includes qualitative and
titative analyses of plankton, bottom organ-
and particulate inorganic and amorphous
r present. Microbiological information in-
s quantitative identification of certain bac-
logical, indicator organisms. Water-tempera-
data represent once-daily observations except
stations where a continuous temperature
rder furnishes information from which daily
nums and maximums are obtained. Fluvial-
nent information is given for suspended-sedi-
ment discharges and concentrations for particle-size distribution of suspended sediment and bed material. (Woodard-USGS)

**QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PART 6. MISSOURI RIVER BASIN.**
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, price $4.70. Water-Supply Paper 2155, 1975. 554 p, 1 fig, 41 ref.

Descriptors: *Water quality, *Surface waters, *Sediment transport, *Hydrologic data, Missiouri River, River basins, Iowa, Kansas, Missouri, Montana, Nebraska, North Dakota, South Dakota, Wyoming, Water temperature, Physical properties, Particle size, Chemical analysis, Inorganic compounds, Biological properties, Streamflow, Gaging stations, Sampling, Sites.
Identifiers: *Missouri River basin.

During the water year ending September 30, 1970, the Geological Survey maintained 258 stations on 123 streams in the Missouri River basin for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 226 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 35 and daily at 67 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical or sediment content. So far as practicable, the water temperatures were taken at about the same time ach day. Quantities of suspended sediment are reported for 38 stations during the year ending September 30, 1970. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 41 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. (Woodard-USGS)
W75-11964

**QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PART 8. WESTERN GULF OF MEXICO BASINS.**
Geological Survey, Reston, Va.
Availble from Supt. of Documents, GPO, Washington, D.C. 20402, price $4.50. Water-Supply Paper 2157, 1975. 532 p, 1 fig, 41 ref.

Descriptors: *Waterquality, *Surface waters, *Sediment transport, *Water temperature, *Basic data collections, Colorado, Louisiana, New Mexico, Texas, River basins, Physical properties, Particle size, Chemical analysis, Inorganic compounds, Biological properties, Streamflow, Sampling, Sites.
Identifiers: *Gulf of Mexico basins(Western).

During the water year ending September 30, 1970, the Geological Survey maintained 246 stations on 144 streams in the western Gulf of Mexico basins for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 241 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 2 and daily at 104 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 27 stations during the year ending September 30, 1970. Sediment samples were collected one or more times daily at most station, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of the sediments were determined at 25 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. (Woodard-USGS)
W75-11965

**QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1969: PART 8. WESTERN GULF OF MEXICO BASIN.**
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, $4.00. Water-Supply Paper 2147, 1974. 567 p, 1 fig, 40 ref.

Descriptors: *Water quality, *Surface waters, *Sediment transport, *Water temperature, Gulf of Mexico, *River basins, *Basic data collections, Colorado, Louisiana, New Mexico, Texas, Physical properties, Particle size, Chemical analysis, Inorganic compounds, Biological properties, Streamflow, Sampling, Sites.
Identifiers: *Gulf of Mexico river basins(Western).

During the water year ending September 30, 1969, the Geological Survey maintained 219 stations on 15 streams in the western Gulf of Mexico basin for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 214 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 1 and daily at 110 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 38 stations during the year ending September 30, 1969. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 34 stations, and particle-size distribution of bed material at 4 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. **1974 WATER RESOURCES DATA FOR OREGON, SURFACE WATER RECORDS, PRECIPITATION RECORDS,**
Oregon State Engineers Office, Salem. Water Resources Dept.
C. L. Wheeler.
1974, 264 p, 4 fig.

Descriptors: *Oregon, *Data collections, *Streamflow, *Precipitation(Atmospheric), Rivers, Streams, Water resources, Surface waters, Surface runoff, Stream gages, Gaging stations, Rainfall, Rain gages, Hydrologic data, Meteorological data, Climatic data, Meteorology, Hydrology.

The surface water records for the 1974 water year (October 1, 1973 through September 30, 1974) for gaging stations and miscellaneous sites within Oregon were presented. The base data collected at gaging stations consisted of records of stage and measurements of discharge. Observations of factors affecting the stage-discharge relation, weather records, and other information were used to supplement base data in determining daily flow. The records of stage were primarily obtained from water-stage records that gave a continuous record of fluctuations. A few records of stage were obtained from direct readings on nonrecording gages. Measurements of discharge were made with a current meter by the general methods outlined in standard textbooks on the measurement of stream discharge. Daily discharge was tabulated for each gaging station, and supporting information about the gaging stations was included. Daily precipitation data from storage precipitation stations operated by the U.S. Forest Service were also given. (Robinson-ISWS)

**HYDROGEOLOGIC DATA FOR THE LOWER CONNECTICUT RIVER BASIN, CONNECTICUT,**
Geological Survey, Hartford, Conn.
J. W. Bingham, F. D. Paine, and L. A. Weiss.
Connecticut Department of Environmental Protection, Hartford, Water Resources Bulletin No 30, 1975. 59 p, 1 fig, 1 plate, 7 tab, 10 ref.

Descriptors: *Hydrogeology, *Hydrologic data, *Connecticut River, *Basic data collections, Test wells, Drillers logs, Aquifer characteristics, Well data, Unconsolidated sediments, Particle size, Water levels, Water quality, Chemical analysis, Streams, Streamflow, Publications, Information retrieval.
Identifiers: *Lower Connecticut River basin.

Geologic, groundwater, and quality of surface water data are presented for the lower Connecticut River basin, Connecticut. For this report, the basin has an area of 639 square miles in south-central Connecticut drained principally by the main stem of the Connecticut River, by its tributaries south of Wilcox Island, and by several smaller streams which drain directly to Long Island Sound. Information collected for this investigation from July 1970 to August 1972 was supplemented by that collected in previous investigations. The primary criteria for selection were records of wells having greater than 2-hour pumping test, depths of stratified drift or till penetrated greater than 20 or 30 feet, respectively, and a location map adequate to field locate the well. The logs of 50 test holes and sieve analyses of the samples collected from them are included. Also included are chemical analyses of surface-water samples collected from 1956-1963. Data on streamflow, quality-of-water, and groundwater levels are published in many U.S. Geological Survey and State of Connecticut reports. These reports, type of data contained, and year of collection are listed. (Woodard-USGS)

K. Friedrich.
Wasserwirtschaft-Wassertechnik, Vol 23, No 1, p 32-34, 1973. 6 fig.

Descriptors: *Plastic pipes, *Construction materials, Corrosion Control, Flow, Water supply.
Identifiers: Germany, Polyvinyl chloride.

In West Germany, pipes from polyvinyl chloride (PVC) will replace between 80 and 90 percent of all pipe materials in new pipelines to be built by 1975. Advantages of PVC pipes include: Complete resistance to corrosion both inside and outside; a high insulating capacity, thus no corrosion due to stray ground electrical currents; a high aging resistance; no interior incrustation; and, higher flow-passing capacity due to surface smoothness. Also simple and inexpensive joints which are easy to insert into the pipe end by hand can be used. The joint, together with rubber sealing, allows for all possible expansion and contraction of the pipelines. Generally a work team of 3 to 4 can lay 400 meters of pipeline in an 8-hour shift. **A MINI-PROJECT FOR AVON HARBOR, NORTH CAROLINA,**
North Carolina State Univ., Raleigh. Center for Marine Coastal Studies.
J. L. Machemehl, and J. C. Bumgarner.
Shore and Beach, Vol 42, No 1, p 3-10, April 1974. 7 fig, 2 tab.

Descriptors: *Waves(Water), *Erosion control, *Harbors, *Channels, *North Carolina, Groins(Structures), Jetties, Channel erosion, Shore protection.
Identifiers: *Avon Harbor(NC).

A detailed analysis of the various methods utilized in stabilizing the entrance of the Avon Harbor, North Carolina, was presented. The harbor was originally constructed in 1946 by the federal government. The entrance channel was repeatedly dredged until 1964; however, wave erosion made the entrance channel almost unusable. To protect it against such erosion,nylon bag groins, timber groins, and nylon bag jetties were constructed. These remedial measures were effective in maintaining the entrance channel and the harbor against storms and wave erosion. (Bhowmik-ISWS)

**SMALL GROINS ON THE SHORES OF LONG ISLAND SOUND,**
New York Ocean Science Lab., Montauk.
T. Omholt.
Shore and Beach, Vol 42, No 1, p 11-13, April 1974. 3 fig, 7 ref.

Descriptors: *Shores, *Groins(Structures), *Erosion, *Beaches, *New York, *Littoral drift, Waves(Water), Stability, Beach erosion, Shore protection, Hydraulic structures, Sands.
Identifiers: *Long Island Sound, *Shoreline recession.

The main results of a groin study on the north shore of Suffolk County, New York, were summarized. A total of 51 groins constructed in 14 areas were surveyed. Over 50% of these groins were 100 feet or less in length and 90% were less than 200 feet. They were mostly constructed of rocks or pre-cast interlocking concrete blocks. Extensive use of aerial photographs was made to study the long-term changes of the shoreline due to groin construction. A trend of shoreline erosion was confirmed. The order of change was generally 30 to 50 feet over the period from 1940 to 1970. In some instances groins helped to decrease the net erosion on the order of 10 to 30 feet. Hoever, groins also had some adverse effects; 30 to 40% of the cases, increased erosion occurred downdrift of the last groin. (Bhowmik-ISWS)

**CORPS' GUIDELINES FOR DAM SAFETY INSPECTION NEED REVAMPING,**
Tennessee Valley Authority, Knoxville. Flood Control Branch.
B. Buehler.
Civil Engineering, Vol 45, No 1, p 74-75 (January 1975). 2 p, 1 photo.

Descriptors: *Dams, *Spillways, *Dam design, *Economic justification, *Dam construction, Safety, Economics, Safety factors, Structural stability, Structural design, Dam foundation, Damsites, Check structures, Engineering geology, Retaining walls, Economic efficiency, Inspection, Dam failure, Structural engineering, Structures, Engineering structures, Economics.
Identifiers: *Dam safety, *National Dam Safety Act of 1972, Administrative regulations, Dam effects.

The Corps of Engineers, as a first step in implementing the 1972 National Dam Safety Act, recently proposed guidelines for safety inspections of existing dams. This author argues that the Corps' safety criteria are too conservative, and will waste millions of dollars needlessly upgrading many dams. Spillway capacity is a prominent aspect of dam safety in the guidelines. Yet, the aspect is criticized for ignoring techniques suggested by the American Society of Civil Engineers task committee for pinpointing the level of spillway safety that best promotes economic efficiency. The structural stability guidelines are also criticized for hinging on conventional safety factors while disregarding hazard categories. In this sense, present guideline stability criteria are inconsistent with spillway criteria. Therefore, the author suggests that modern, practical, and consistent spillway criteria are needed in order to deal effectively with low and high hazards. Several proposals are presented that the author feels would greatly increase the effectiveness of the guidelines, while at the same time releasing millions of dollars which could be used on other programs affecting human welfare. (Hoffman-Florida)

**RIVER CROSSING PERMITS FOR BUCKEYE PIPE LINE CO. PROPOSED PETROLEUM PRODUCTS PIPELINE SYSTEM BETWEEN LINDEN, NEW JERSEY AND MACUNGIE, PENNSYLVANIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer Div. North Atlantic, New York.
National Technical Information Service, Springfield, Va 22161, USDC as EIS-NJ-73-1917-F, $11.25 in paper copy, $2.25 in microfiche. December 11, 1973. 447 p, 27 fig, 25 tab.

Descriptors: *Environmental effects, *Pipelines, *Oil, *Permits, *Northeast US, New Jersey, Connecticut, Transportation, Rivers, Regulation, Federal government, Administrative agencies, Environmental control, Aesthetics, Oil pollution, Pressure conduits, Engineering structures, Conveyance structures, Pipes, Water pollution sources, Water quality control.
Identifiers: *Environmental impact statements, Linden(NJ), *Macungie(Pa), Hazardous substances(Pollution).

River crossing permits are sought for construction of a subterranean petroleum pipeline to run from Linden, New Jersey to Macungie, Pennsylvania. The area is not ecologically 'unique', since it is highly modified by human activity and has been affected by an existing pipeline. Environmental impacts of the project include disruption of aquatic and terrestrial biota, soil erosion, sedimentation, and increased turbidity during construction in waterways. Permanent constraints will be imposed on the planting of trees along the corridor. Adverse environmental effects include: habitat disruption, flora and fauna displacement, erosion, sedimentation, increased stream turbidity, the possibility of pipeline ruptures, and esthetic impacts. Although the proposed project was the most feasible action, the following alternatives were proposed: (1) an alternate route, (2) alternate methods of transportation, and (3) no action. Construction and operation of the new pipeline will promote flexible use of the area and will not affect long-term productivity. Other than time, energy, and material there are no irreversible and irretrievable commitments of resources involved in the proposed action. Comment received indicated concern over environmental effects, but was not considered significant enough to warrant hearings. (Fernandez-Florida)

**GRAPHIC SOLUTIONS TO TUBING MOVEMENT IN DEEP WELLS,**
Baker Oil Tools, Inc., Oklahoma City, Okla.
N. F. Moseley.
Petroleum Engineer, Vol 45, No 3, p 59-66, March, 1973. 5 fig, 1 tab.

Descriptors: *Casings, Movement, *Buckling, *Deep wells, *Graphical analysis, Graphical methods, Analytical techniques, Pressure, Temperature, Wells, Water wells, Well casings, Pipes, *Tubes.
Identifiers: *Tubing movement.

Tubing movement can be divided into four classes according to the force acting on the tubings. They are: (1) movement due to piston force; (2) buckling movement due to differential pressure; (3) movement due to a ballooning force; and (4) movement due to temperature force. These forces, with the exception of number 2, are straight line functions of pressure and temperature differential. Therefore plots may be made of the movement versus the pressure or temperature to obtain a useful graph. The formulas for each of these graphs are derived and an example using actual data illustrates the derivation and use of these graphs. (Bradbeer-NWWA)

fiers: *Gravel pack, *Snad bridging,
el-to-sand ratio, Caving.

bridging is an extensively used form of sand
l in gas and oil wells and can be accom-
plished by the use of screens, gravel packs or plastic-coated gravel. Results are discussed of an experimental investigation designed to find the most effective gravel-to-sand size ratio for an effective gravel pack. A ratio of less than 6, preferably 4, will give a stable pack. Angular gravel and uniform formation sand promote the highest pack stability. Results were confirmed by the examination of this sections. (Bradbeer-NWWA)

**A MATHEMATICAL MODEL FOR HEAD-DISCHARGE RELATIONSHIPS FOR VARIOUS FERRULE-HOUSE SERVICE PIPE COMBINATIONS,**
Don Bosco Polytechnic, Calcutta (India).
D. N. Ghose, and N. Chaudhuri.
Journal of the Institution of Engineers, India, Vol 53, Part PH1, p 14-20, October, 1972. 10 fig, 6 tab, 2 ref.

Descriptors: *Mathematical models, *Pipes, Conduits, Discharge measurement, Model studies.
Identifiers: Calcutta, India, Ferrules.

A mathematical model, based on the principles of hydraulics, has been developed to describe the head-discharged relationships for various combinations of ferrules and house service pipes commonly used in Calcutta. From the experimental results it was possible to derive the relationship Q sub x = A sub s to the nth power x (base length/length of house service pipe) to the nth power, a modification of the well established head-discharge relationship Q = KH to the nth power. In this expression, A = Kl sub l to the nth power, l sub l is the base length, K the constant for a parбicular ferrule-service pipe combination, n = 0.54 for all combinations, and s = H/l sub x, where H is the dynamic water head in street water main and l sub x the length of a house service pipe. The values of A for all combinations of ferrules and pipes were experimentally determined. Using the values of A, discharge from a given length of pipe under a given dynamic head may be computed. A set of graphs relating Q and s has been provided for all combinations of ferrules and house service pipes for quick estimation of probable dishcarges. (Sandoski-FIRL)

**APPARATUS, FOR AND METHOD OF CONTROLLING FLOW OF FLUIDS IN A PIPELINE,**
Talbot (F. W.) Co. Ltd., Winchester (England). (Assignee).
E. G. B. Gledhill.
United States Patent 3, 722,520. Issued March 27, 1973. Official Gazette of the United States Patent Office, Vol 908, No 4, p 926, March 27, 1973.

Descriptors: *Pipes, *Flow control, Valves, Pipelines, Water conservation, Patents.
Identifiers: Stopcocks.

A method and apparatus for controlling the flow of fluid in a supply pipe to a premises such as a water supply pipe or a gas supply pipe are described. A small bore high pressure tubing is provided preferably alongside the standard supply pipe and communicates between a main stopcock arranged to control the flow of fluid from a supply into the premises' supply pipe and the various valves in the premises. The main stopcock and the control valves have an apertured diaphragm providing the only means of communication between the small bore tubing and the supply pipe. When one of the control valves is opened, pressure is released in the small bore tubing to lift the diaphragm off the seat of the main stopcock to permit flow of fluid through the main stopcock into the supply pipe and vice versa. Instead of relying upon pressure signals to open and close the main stopcock, electrical signals can be used. By fitting such apparatus into a domestic water or gas supply, water or gas will only flow into the domestic system through the main stopcock when required. Thus, wastage of water or gas in the event of a leak in the pipeline between the main stopcock and the premises will be prevented. (Sandoski-FIRL)

**SWIRLING LAMINAR PIPE FLOW OF SUSPENSIONS,**
Illinois Univ., Urbana. Dept. of Mechanical and Industrial Engineering.
S. K. Tung, and S. L. Soo.
Journal of Applied Mechanics, Vol 95E, No 2, p 331-336, June, 1973. 5 fig, 22 ref.

Descriptors: *Mathematical studies, *Pipe flow, Velocity, Hydraulics, Hydraulic models, Reynolds number.
Identifiers: Flow of suspensions, Navier-Stokes equations.

Vortex pipe flow of suspensions with laminar motion in the fluid phase has been examined. The pipe consists of two smoothly joined sections, one stationary and the other rotating with a constant angular velocity. The flow properties of the fluid phase are determined by solving the complete Navier-Stokes equations numerically with governing parameters being the flow Reynolds number and swirl ratio. Subsequent numerical solution to the momentum equations governing the particulate phase provides for both particle velocity and concentration distributions. The method can be applied to many other fluid flow or two-phase flow problems. It also provides an easy check on the results obtained by using some other approximated methods. (Sandoski-FIRL)

**HOW TO EVALUATE WATER MAIN CAPACITIES, PART I,**
M. D. Curry, and R. R. Wright.
Water and Sewage Works, Vol 122, No 5, p 98-101, May, 1975. 2 fig, 3 tab.

Descriptors: *Water distribution(Applied), *Pipelines, *Roughness coefficient, *Head loss, Hazen-Williams equation, Roughness(Hydraulic), Pipe flow, Water conveyance.

Periodic evaluations of water distribution systems should be performed to protect the monetary investment in constructing this portion of the water supply system. Generalized procedures are available that permit field flow tests and express the system performance in quantitative terms. The importance of the roughness value (C factor) in distribution main analyses is stressed. The C factor is used in the Hazen-Williams formula for hydraulic calculations and represents the resistance to flow or roughness coefficient. Determination of C factors of arterial mains allow the main capacity to be expressed in quantitative terms for comparison with expected performance. The C factor represents quantitatively the head loss in a pipe. Variation in resistance to flow affects the friction loss in a water main and the flow capacity. The C factor is affected by inside pipe diameter and by pipe roughness. Visual observation of sections of a water main may not show the actual roughness present throughout the pipe. Typical C factors for various pipes are given. Four case studies representing C factors determined in the field are presented. Actual values to be expected in any particular community are dependent upon such parameters as the type of water treatment used, control of the treatment processes, soil conditions, and velocities. Measures are mentioned that will aid in the prevention of loss of main capacity. (Orr-FIRL)

**WATERFLOODING OF OILFIELDS IN WYOMING TO 1968,**
Bureau of Mines, Laramie, Wyo. Mineral Resources Field Office.
P. Biggs, and C. A. Koch.
Report of Investigations 7469, December, 1970. 147 p, 32 fig, 4 tab, 7 ref.

Descriptors: *Flooding(Oil recovery), *Groundwater, Wells, *Oil industry, Permeability, Aquifer characteristics, *Wyoming.
Identifiers: Waterflood projects, Reservoir data, Oil-in-place, Oil production, Madison Formation(Wisc).

Information is provided on 138 waterflood projects in Wyoming. Injection was in 25 producing zones and 65 fields. Specific data presented include field location, discovery and development, water supply and injection, oil and water production, estimates of oil in place, and oil recoveries by primary and secondary methods. The 138 projects studied will, if successful, recover about 800 million barrels of secondary oil. Almost all of the injection water is from deep water wells. Estimated water requirements total 1,225,000 acre-feet. The equivalent of 237,000 acre-feet had been injected by January, 1968. The Elk Basin-Madison and Salt Creek-Second Wall Creek projects each expect to recover more than 100 million barrels of oil by waterflooding. Totaling all projects, the daily production in December, 1967, was 195,600 barrels of oil and 501,500 barrels of water. Most of the injection water is from the Madison Formation and is unfit for domestic or agricultural use. Usually a closed water system is used, and occasionally filtering and chemical additives are necessary. (Campbell-NWWA)

Identifiers: *Solution mining techniques, In situ mining, Potash, Halite, *Brine disposal, Leaching, Well completion, Hydraulic fracture, Multiple well systems, Well costs, Sulphur, Microbial activity.

Solution mining techniques present a means of extracting soluble ores, particularly such materials as salt and potash, from horizons which are not accessible by conventional mining. In the process of dissolving materials, it is evident that solution may be complete or partial. In general, the solution mining operations are described and relate to complete solution of the desired compound. Even though the solution of material is complete, there may be instances in which insoluble material is present to a large extent either as granular separated particles or as insoluble layers. The process required for obtaining the desired product involves access wells to reach the deposits, sufficient water supply to yield the production goals, and the development of an underground cavity. The process of solution mining, therefore, depends to a great extent on three factors: availability of a relatively pure strata or formation of salt or potash to be mined, access well or wells, and adequate control of the solutioning process so that enlargement of underground cavities can be fairly well delineated. (Campbell-NWWA)

Descriptors: *Rotary drilling, *Wells, Cost anal sis, Drilling equipment, Cementing, Drillin *Mining, *Canada.
Identifiers: *Turbo-drilling, *Potash, Boreho deviation control, Wedging, Blairmore formatio *In situ mining, Lost circulation.

Control of borehole deviation in drilling the ring holes (4-5 ft apart and 2000 ft deep) required shaft-sinking in the Saskatchewan potash field the freezing method is discussed. A system turbo-drilling with directional 'kick-sub', inste

ing, was adopted to correct deviations in y-drilled freezing holes around Esterhazy, , Duval, and Patience Lake shafts. The igs and equipment used are outlined, and ce layout adopted for simultaneous multi- ng with minimum transfer time between described. Problems encountered during ng of the glacial till and the Blairmore For- are referred to, and the cementing re employed is described. The experience se of turbo-drilling in freeze-hole drilling n very satisfactory since its first use at zy. The precision in the hole patterns d over these 6 shafts has demonstrated the bility of this technique and justified the concept of applying turbo-drilling for ole application. From the point of view of ng engineer, the precision locations of the oles enabled the construction of the rela- ick and uniform ice walls to withstand the drostatic pressures at these depths to be ut safely. The speed of operation was pre- —an essential factor in the critical path s for these very expensive projects. ell-NWWA)

DOWNHOLE TEMPERATURES, PRES- AFFECT DRILLING, PART 2, DETECT- ND EVALUATING FORMATION PRES- ,
ntal Oil Co., Ponca City, Okla.
Fertl, and D. J. Timko.
Oil, Vol 175, No. 1, p 45-50, July, 1972. 3 b, 27 ref.

tors: *Drilling, *Temperature, *Pressure, pressure, *Measurement, Geophysics, mud, Techniques, Evaluation, Oil, lwater.
ers: Abnormal pressure, Formation pres- rill cuttings.

The methods of detection of formation pressures and an evaluation of these methods as to their effectiveness, are presented. About 35 detection methods are described. These are divided into 6 categories in relation to the source of data. The categories are: (1) geophysical methods, (2) drilling parameters, (3) drilling mud, (4) drill cuttings, (5) well logging, and (6) direct pressure measuring devices. (See also W75-11865) (Bradbeer-NWWA)

W75-11869

**TESTS SHOW JET DRILLING HAS PROMISE,**
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (Netherlands).
R. Feenstra, A. C. Pols, and J. van Steveninck.
Oil and Gas Journal, Vol 72, No 26, p 45-57, July 1, 1974. 12 fig, 6 tab, 23 ref.

Descriptors: *Jets, *Drilling, *Deep wells, *Drilling equipment, Flow, Nozzle, Drilling fluids, Hydraulics, Laboratory tests, On-site investigations, Shale, Wells, Oil wells, Water wells.
Identifiers: *Jet drilling, Groningen gas field, Shell oil.

An investigation was made with the aid of three laboratory-type drilling machines which permit tests on both microbits (1.5 in) and full-scale bits (6.5 - 9.628 in). In view of the application of jets to deep wells, care was taken to simulate hydrostatic pressures as they exist in the field on the hole bottom. These have a major effect on bit-penetration rate. The extensive experiments performed are listed and their procedure recorded. The results of the laboratory tests are presented. Field tests in tertiary shales below 1700 ft at the Groningen gas field show that 9.628 in holes could be jetted in weak formations at satisfactory rates using 5000 psi equipment. (Bradbeer-NWWA)
W75-11880

**NEED WAYS TO REDUCE DRILLING COSTS,**
C. C. Daly.
Oilweek, Vol 23, No 52, p 12-13, February 12, 1973. 2 fig.

Descriptors: *Drilling, *Costs, *Cost-benefit analysis, *Economic efficiency, Oil wells, Water wells.
Identifiers: Penetration rate, *Drilling rate.

Several methods of reducing drilling costs were tested in problem boreholes such as those that penetrated Mississippian shales that have a tendency toward a sloughing after being water-wet for a number of days. Non-wetting lubricants were used, such as Drispac Soltex, a polyanionic cellulosic polymer and a sodium asphalt sulfonate. They substantially increased penetration rates. (Bradbeer-NWWA)
W75-11884

**WANTED: FEWER BIT, CASING SIZES, REWARD: MANY BENEFITS FOR INDUSTRY,**
Armco Steel Corp., Middletown, Ohio.
R. L. Vingoe, and J. H. Cook.
Drilling, Vol 36, No 7, p 33-39, May, 1975. 1 fig, 6 tab.

Descriptors: *Drilling equipment, *Water wells, *Oil wells, *Casings, *Drill bits, Size, Weight, Statistical analysis, Economics, Standards.

A substantial reduction in the number of sizes of rock bits and the number of sizes and weights of casing furnished industry would result in many benefits, including delivery of the products, all in critical supply, beneficial elimination of little-used items, and standardization of a more streamlined product line. A group of Armco and Hughs personnel was formed to standardize on an optimum number of sizes and weights of bits and casing which would satisfy the industry's requirements. A study was made to determine the existing demand for various product sizes and the data are presented. (Bradbeer-NWWA)
W75-11885

**BIT DESIGN IS KEY TO DEEP DRILLING WITH TURBINES,**
Shell Oil Co., New Orleans, La.
J. E. Fontenot.
Oil and Gas Journal, Vol 73, No 23, p 39-43, June 9, 1975. 11 fig, 4 ref.

Descriptors: *Design criteria, *Drilling equipment, *Turbines, *Rotary drilling, Electric motors, Drilling, Wells, Deep wells, Ground water, Oil, Performance, Efficiencies.
Identifiers: *Diamond bit design, Torque, Downhole motor, Drill bit, Drill string.

The use of a downhole mud motor in place of a rotary drill could increase the ability to put power down the borehole efficiently. There is an increase in the specific horsepower per square inch available at the bottom of the hole with the turbine mud motor. This increased available power allows deep drilling with less torque on the drill pipe than a rotary drill, thus keeping expenses on drill pipe maintenance to a minimum. Rock bits have performed poorly, however, on the turbine, and the results using diamond bits have been inconsistent. The diamond bit should be studied and redesigned to feature low torque, good cleaning at low bit-pressure drop, high penetration rate at low weights on bit and long life (50-100 hr). (Bradbeer-NWWA)
W75-11889

**DRILLING IMPEDANCE OF MUD SOLIDS,**
M. D. Nelson.
World Oil, Vol 180, No 2, p 55-60, February 1, 1975. 5 fig, 5 ref.

Descriptors: *Drilling, *Penetration, *Drilling fluids, Boreholes, Clays, Brines, Emulsions, Mud, Slurries.
Identifiers: *Specific drilling impedance, Mud solids, Drilling rate.

Solids in drilling fluids adversely affect drilling rates, and relative comparisons of different types of solids have been made in the past. However, new information is presented that includes a method of determining the quantitative effect a particular solid has on drilling. Specific drilling impedance is a measure of the amount solids reduce penetration rates, under a given set of conditions. (Bradbeer-NWWA)

**INFLATABLE PLUG CUTS MESS, CLEANUP ON SEWERLINE BYPASS,**
Robbinsdale Water and Sewer Superintendent's Office, Minn.
G. Austin.
The American City, Vol 88, No 4, p 22, April, 1973. 1 fig.

Descriptors: *Sewers, *Repairing, *Bypasses, Floods, Castings, Aluminum, Construction materials, Equipment, Waste water treatment.
Identifiers: Inflatable plugs, Sewer repair.

A specially designed inflatable plub, used for bypassing when sewer repairs are required, eliminates flooding and the ensuing cleanup problems. The plugs, known as Muni-Balls, are manufactured by Cherne Industrial, Incorporated, of Edina, Minnesota and come in sizes from 6 to 53 inches in diameter. Made of an elastic compound and molded on high tensile strength aluminum castings, they include a removable plug in the center ranging from 1 to 4 inches in diameter. (Sandoski-FIRL)

P. Venkataraman, and K. Subramanya.
Water Power, Vol 25, No 5, p 189-190, May, 1973. 3 fig, 5 ref.

Descriptors: *Mathematical studies, *Weirs, Flow rates, Flow measurement, Outlets, Sampling, Waste water treatment.
Identifiers: Sediment chambers, Analytical profiles, Linear proportional weirs.

Linear proportional weirs are those weirs for which the rate of flow is proportional to the linear power of the head measured above the datum. Because of this characteristic these weirs find their use as flow measuring devices, outlets for sediment chambers, and controls for float-regulated dosing and chemical sampling. In the Keshavamurthy and Seshagiri generalized theory of proportional notches, the shapes of the weir profile designed to maintain the linear relationship between the head and discharge are complex while being analytically sound. To simplify the profile for purposes of practical application while maintaining the essential linear proportional quality, an experimental investigation was conducted utilizing a weir formed by two quadrants of a circle. The quadrant plate notch can thus be used to obtain a linear proportionality between the head and discharge This device has the advantage of simplicity of profile and is thus easy to construct, and in addition it does not have the restrictions imposed on some of the exact analytical profiles. **SCREEN RETAINER ASSEMBLY,**
Robertshaw Controls Co, Richmond, Va.
D. K. Murrell.
United States Patent 3,732,985. Issued May 15, 1973. Official Gazette of the United States Patent Office, Vol 910, No 3, p 832, May 15, 1973.

Descriptors: *Screens, *Conduits, *Patents, Equipment, Installation.
Identifiers: *Screen retainer assembly.

A screen retainer assembly for use in a conduit is described. The method includes the steps of draping the screen across a convoluted band of ductile material, positioning the screen-draped band within the conduit in general alignment with a continuous groove provided in the interior surface of the conduit, and expanding the convoluted band so that the band fits snugly in the groove thus to hold the screen firmly in place with its periphery pinched between the band and the groove. The resultant screen retainer assembly has the advantages that the screen retaining means does not impede the flow of fluid through the conduit and that the expanded band cannot become displaced or accidentially removed. **DIGESTER GAS: VALUABLE PLANT FUEL,**
South Burlington Waste Treatment Plant, N. C.
A. D. Everett.
Water and Sewage Works, Vol 122, No 5, p 60-61, May, 1975. 4 fig.

Descriptors: *Methane, *Instrumentation, Natural gas, Fuels, Equipment, North Carolina, *Gases, *Treatment facilities, Recycling.
Identifiers: *Digester gas.

The South Burlington waste treatment plant, Burlington, North Carolina, uses digester gas (Essentially methane) to power three 150-hp engines at a rate of 1200 scfh to drive the centrifugal blowers for the aeration tanks. Approximately $4,000 per year in fuel costs are saved by using digester gas instead of natural gas. American Meter rotating-vane type positive displacement meters have been installed in place of the conventional diaphragm meters commonly used for a check on digester gas consumption. Two meters are used in the system, one measures digester gas to the three air blower engines and the other measures excess digester gas that must be consumed in a waste burner. Greater than 95% of the digester gas produced is normally used. Periodic readings of the two meter totalizers show the total gas usage. An interchangeable measuring cartridge contained on the CVMP-S meter simplifies maintenance and maintains the meter's accuracy. Dirt, pipe scale, and corrosive vapors are prevented from reaching the gears by a magnetic drive on the meter which enables the gear box to be isolated from the flowing digester gas. Pre-lubricated bearings are sealed so that they are not exposed to the degreasing effect of digester gas condensates. The meters may be installed horizontally in three-inch pipe loops or mounted in vertical lines. (Orr-FIRL)

**PRESSURE CONTROL IN A MOUNTAIN AREA WATER SYSTEM.**
Public Works, Vol 106, No 5, p 100-101, May, 1975. 1 fig.

Descriptors: *Water pressure, *Mountains, California, Valves, Hydrants, Design, Energy dissipation, *Water distribution(Applied), Water delivery.

The Crestline-Lake Arrowhead Water Agency, located northeast of Los Angeles in the San Bernardino mountains, draws water from the Feather River Aqueduct. It wholesales this water to 27 outlets servicing 10,000 customers, and also acts as a fire service. During design of the system, it became apparent that to maintain a practical distance between hydrants, many hydrants would be placed in areas where the pressure (850 psi) would exceed the capabilities of the fire fighting equipment. Therefore, the agency built a test facility costing $27,000 to evaluate the capability of control valves needed to reduce pressures. Cavitation was observed below the valve rather than within it-10 to 15 diameters downstream of the valve. A temporary energy dissipator was devised consisting of river rocks (3/4 to 1-inch) stuffed into a 4 1/2-foot long section of a 6-inch water main, with 1/4 by 1-inch steel bars welded across the end of the piece. With cavitation taking place in the dissipator, the rocks appeared to have been split in half. The rocks and bars were evaluated, and a permanent dissipator was designed and patented. The configuration of the energy dissipator can be changed to meet flow demand conditions. The tube-like device has been made in lengths of 18 inches to 4 1/2 feet, and is filled with steel balls furnace-welded together. (Murphy-FIRL)

PERCUSSIVE DRILLING: WITH INDEPENDENT ROTATION,
Bureau of Mines, Twin Cities, Minn. Twin Cities Mining Research Center.
H. F. Unger, and R. R. Fumanti.
Report of Investigations 7692, 1972. 21 p, 16 fig, 4 tab, 8 ref.

Descriptors: *Drilling, *Drilling equipment, Mining, Rock strength, *Wells, Core drilling, Rock mechanics, Sampling, Bits.
Identifiers: *Percussive drilling, Rock properties, Rotational speed, Drilling thrust, Penetration rate, Surface-set diamond bits, Impregnated diamond bits, Diamond drilling data, Laboratory drilling tests, Field drilling tests, Energy requirements.

The Bureau of Mines conducted drilling experiments in the laboratory with a commercially available percussive drill that has an independent rotational system. Eight rock types with a wide range of physical properties were drilled under several combinations of rotational speed, drilling thrust, and operating pressure. Penetration rates and energy per unit volume correlated well with the coefficient of rock strength as shown graphically. Size-distribution analyses of some of the drill cuttings show how particle size varies with rotation speed and rock hardness. In general, changing the rotational speed has a greater influence on the penetration rate in softer rocks, with penetration rate increasing with increasing rotational speed. Although the physical properties of the rocks are an indication of their drillability characteristics, no single property correlates perfectly with the results of percussive drilling. The coefficient of rock strength number, determined by fracturing a sample in a manner similar to that of percussive drilling, correlates well with penetration rates and energy per unit volume for the independently rotated percussive drill.
W75-12383

DRILLABILITY STUDIES: PERCUSSIVE DRILLING IN THE FIELD,
Bureau of Mines, Twin Cities, Minn. Twin Cities Mining Research Center.
R. L. Schmidt.
Report of Investigations 7684, 31 p, 1972. 11 fig, 10 tab, 11 ref.

Descriptors: *Drilling, *Drill holes, Drilling equipment, Mining, On-site investigations, Construction equipment.
Identifiers: *Rock drillability, *Percussive drilling, Laboratory drilling data, Mobile drill units, Tensile strength, Compressive strength, Young's modulus, Poisson's ratio, Penetration rate, Thrust, Speicfic energy, Button bits, Operating pressure.

One of a series published by the Bureau of Mines covering research investigations in rock drillability, this report of field drilling results extends earlier laboratory findings and provides a relatively simple procedure for predicting percussive drilling rates with reasonable accuracy. Two percussive drills mounted on a truck were used to drill a total of 25 rock types, and the results were used to develop a prediction equation. The equation was tested on a set of unrelated laboratory percussive drilling data, and the comparison between predicted and actual rates is shown in tabular form. Of the physical properties investigated, compressive strength gave the best correlation with percussive drillability. No physical property by itself is considered a good predictor of drillability. A step that considers the energy output of the drill must be included in the procedure. The simplest procedure for predicting penetration rates is to determine the coefficient of rock strength of the rock to be drilled and use this value to determine the apparent specific energy of the rock. Substituting the apparent specific energy in the equation developed yields a reasonably accurate drillability prediction. (Campbell-NWWA)
W75-12384

FRAGMENTATION.
SME Mining Engineering Handbook, Vol 1, Section 11, p 11-1 to 11-60, 1973. 54 fig, 19 tab.

Descriptors: *Drilling, Rock mechanics, Bits, Rotary drilling, Oil industry, *Drillability, Drilling equipment, *Mining.
Identifiers: *Fragmentation, Fracture energy, Plasticity, Penetration rate, Rock strength, Percussion drilling, Blasthole drilling, Down-the-hole hammer, Thermal drilling.

Energy must be supplied to rock by direct or indirect means to fragment that rock. The amount is dependent upon the properties of the rock and the type of loading system. Fragmentation energy is consumed by three main mechanisms: (1) creation of new surface area (fracture energy), (2) friction (plasticity) and (3) elastic wave energy dispersion. The state of the art in property testing permits only relative measure of the ease with which rock breaks. Such measures have not been rigorously linked to excavation or comminution costs or rates. Laboratory tests for quantifying energy input requirements to cause fragmentation under various controlled degrees of confinement and loading rate will be increasingly important in aiding the understanding and analysis of rock fragmentation systems. (Campbell-NWWA)
W75-12387

CHEMICAL FRAGMENTATION,
W. H. Engelmann.
SME Mining Engineering Handbook, Vol 1, Section 11, p 11-112 to 11-123, 1973. 152 ref.

Descriptors: *Drilling, Rock Mechanics, *Rotary drilling, Oil industry, *Drilling fluids, Bits, Bibliographies.
Identifiers: *Chemical fragmentation, Penetration rate, Drilling variables, Diamond bits, Inorganic additives, Organic additives, Bit life.

The term chemical fragmentation is defined as the breakage, fracture or comminution of rock or mineral materials by mechanical forces, aided by the presence of chemical solutions. The latter usually are in the form of the aqueous pulp of a ball-mill grinding circuit, or the flushing and cooling fluids pumped down the hollow drill stem to the drill bit. Grinding and drilling are, therefore, the two most important processes benefiting by chemicals in solutions. Although these processes are emphasized, other chemically induced changes in rock toughness, as determined by special laboratory tests are also noted. Any reduction in direct-energy requirements, even by a few percentage points, can offer a cost benefit considerably greater than the cost of the chemical additives. While energy per unit volume using additives is higher than for water, the overall cost: benefit is very low. Other chemical enhancement of drilling variable is considered, such as penetration rates. Recent field drilling tests run by the Bureau of Mines, using anionic, cationic and nonionic surfactant solutions as flushing fluids for surface-set diamond bits have shown that penetration rates can be increased as much as 50% over that with water alone. These examples have demonstrated that chemical additives play an important role in conserving diamond bits and energy in rock fragmentation and removal processes. (Campbell-NWWA)

CEMENTING OFF, PLUGGING, AND REDRILLING,
Dow Chemical Co., Tulsa, Okla. Dowell Div.
J. E. McGinty, and D. G. Calvert.
Water Well Journal, Vol 29, No 7, p 43-46, July, 1975.

Descriptors: *Cementing material, *Wells, *Groundwater, Drilling, Water wells, Aquifer characteristics, Subsurface waters, Casing.
Identifiers: Lost circulation, Well abandonment, Casing seats, Sanitary seal, Undesirable fluids, Recompletions, Gypsum cement, Neat cement, Concrete, Placement techniques.

In recent months interest has been shown by local, state, and federal control boards in the cementing off and plugging of water wells. The following article discusses these points of interest as well as redrilling techniques. There are many reasons for setting cement plugs. Many times plugs are set during the drilling operations, upon completion of the drilling operations and for zone or well abandonment. The following are some of the specific reasons for cement plugs: (1) whipstock or kick-off, (2) shut off undersirable formation fluids, (3) lost circulating during drilling, (4) recompletion, (5) casing seats, (6) zone abandonment, (7) well abandonment. The effect of mix water and cement temperature is a factor that must be considered when designing systems for plug cementing. There are many cement systems that may be designed for use in plugging wells. The following are some of the most commonly used: (1) Gypsum cement (Gypseal, Calseal), (2) Neat cement, (3) Concrete, (4) Reduced water cements, (5) Regulated fill-up cement. Placement techniques are also discussed. (Campbell-NWWA)

A NEW APPROACH TO PERMEABILITY REDUCTION,
Marathon Oil Co., Littleton, Colo.
C. T. Presley, P. A. Argabright, R. E. Smith, and B. L. Phillips.
Journal of Petroleum Technology, Vol 27, p 592-594, May, 1975. 2 fig, 2 tab, 12 ref.

Descriptors: *Permeability, *Oil reservoir, *Colloids, *Clogging, *Control, *Well filters, Groundwater, Aquifer, Flow augmentation, Wells, Seepage, Gravels, Coarse aggregates, Storage.
Identifiers: *Sand bridging.

A new class of polyelectrolytes, polyisocyanurate salts, was evaluated as a permeability reducing agent. The permeability reduction involves plugging interpore flow channels with colloidal particles that are generated in situ. This process is operative up to about 150F. This method has many advantages including the flexibility to designate the final permeability as almost any desired fraction of the initial permeability. (Bradbeer-NWWA)

HOLE-TO-HOLE GEOPHYSICAL MEASUREMENT RESEARCH FOR MINERAL EXPLORATION,
Geological Survey, Denver, Colo.
J. H. Scott, J. J. Danils, W. P. Hasbrouck, and J. Y. Guu.
In: Society of Professional Well Log Analysts Sixteenth Annual Logging Symposium, June 4-7, 1975, 14 p. 6 fig, 21 ref.

Descriptors: *Borehole geophysics, *Electric well logging, *Exploration, Mineral industry, *Cross-sections, Coal, Seismic studies, Radioactivity, Resistivity, Mining, Locating, Subsurface investigations, Mapping, Metals.
Identifiers: Uranium ore.

A major deficiency exists in state-of-the-art borehole geophysical measurements available to the mineral industry -- the inability of conventional well-logging techniques to 'see' more than a few meters from a borehole. Hole-to-hole and hole-to-surface geophysical measurements offer the possibility of extending the range of investigation to 3-300 m. A review of previous research indicates that a few extended-range borehole geophysical techniques have been developed for specialized problems in petroleum and mineral exploration. Two new applications show special promise: hole-to-hole electrical measurements for uranium exploration and hole-to-hole seismic measurements for coal-seam testing. Results of recent field tests and computer model studies indicate that these techniques can improve exploration efficiency by reducing the number of drill holes needed for finding uranium orebodies and by certifying the continuity of coal seams. SEISMIC EXPLORATION: ITS NATURE AND EFFECT ON FISH,
Fisheries and Marine Service, Winnipeg (Manitoba).
M. R. Falk, and M. J. Lawrence.
Technical Report Series No CEN-T-73-9, 1973, 51 p. 12 fig, 4 tab, 21 ref.

Descriptors: *Seismic exploration, *Fish, Explosives, *Environmental effects, Seismic waves, Fish management, Marine fish, Aquatic animals, *Fishkill, Canada.
Identifiers: Sparker, Aquapulse, Hydrosonde, Airgun, Seismic profile.

The nature of seismic exploration in offshore and inland waterbodies of the Northwest Territories, as well as the effects on fish are described. Literature pertaining to the nature and effect of explosive and non-explosive seismic energy sources is presented. A study is described of the effects that seismic energy sources commonly used in the Northwest Territories have on fish. Caged Arctic cisco (Coregonus autumnalis) and other small Coregonids were subjected to the energy sources to determine their lethal characteristics. Aquaflex (a linear high explosive) detonated in 165 foot lengths on the bottom in 10 ft of water, killed fish over an area of 36,200 square foot. A 10 pound charge of 60% Geogel (a point high explosive) detonated 10 ft below the surface in 15 feet of water, killed fish over an area of 25,540 square feet. In contrast, a 300 cubic inch Par Air Gun caused no direct fish mortalities. (Cambell-NWWA)

CERS AID PLACEMENT OF STIMULA-
FLUIDS,
Oil Co., Andrews, Tex.
Lilley.
Oil and Gas Journal, Vol 72, No 24, p 62-64, June 17, 1974. 6 fig, 1 tab.

Descriptors: *Tracers, *Secondary recovery(Oil), *Radioactivity techniques, Tracking techniques, Injection, Hydrofracturing. Leakage, Plugging, Testing procedures, Groundwater movement, *Texas.
Identifiers: Cochran County(Tex), Ward County(Tex).

A new procedure using radioactive tracers is useful in placing well-stimulation and fracture fluids, isolating theif zones in injection wells for proper placement of plugging agents, and in controlling water flow from a permeable zone in the middle of an oil pay. The method of emplacement is described and related problems discussed. This method has been utilized in the North Ward Estes field, Ward County, Texas and in the Slaughter Field, Cochran County at depths of approximately 2500 ft and 5000 ft respecitively. The results are tabulated. (Campbell-NWWA)

**USE OF PLASTIC PIPE FOR SEWERS,**
Otay Municipal Water District, Spring Valley, Calif.
G. M. Reiter, and L. Hirsch.
Public Works, Vol 104, No 4, p 88-91, April. 1973. 4 fig, 1 tab.

Descriptors: *Sewers, *Plastic pipes, Construction, California, Pipelines, Costs, Laboratory tests, Waste water treatment.
Identifiers: Otay Municipal Water District(Calif).

Plastic pipes are beeing used in the construction of sanitary sewers for a California area having a steep hillside terrain with rock outcroppings. After much construction bidding and rebidding for the 70,000 feet of pipeline, the Otay Municipal Water District permitted the use of plastic pipes. These pipes have demonstrated the following advantages: low material cost; long, lightweight pipe lengths, permitting easy handling, storage, and laying; pipe flexibility allowing maximum curvatures; fast, positive air pressure testing; narrow trench digging; and, simpler manhole construction with longer spacing and compatibility with plastic laterals and saddles. Prior to use of such pipes, specific laboratory tests were performed. Tests consisted of subjecting pipe specimens to extreme conditions - far exceeding normal anticipated operating conditions for periods up to 18 days. The tests corroborated results reported from major research and testing programs. (Sandoski-FIRL)

**PIPE FLOW MEASUREMENTS BY THE PULSE VELOCITY METHOD WITH RADIOACTIVE ISOTOPES,**
P. Wurzel.
The Civil Engineer in South Africa, Vol. 15, No. 2, p 33-38, February, 1973. 4 fig, 1 tab, 7 ref.

Descriptors: *Pipe flow, *Measurement, *Radioisotopes, Instrumentation.
Identifiers: Scintillation rate-meter.

A radioactive system for broad angly detection of pipe flow measurement using AERE 1413A scintillation rate-meter gives flatter wave forms with lower repeatability and requires relatively higher radiation mass dosages per injection as compared with a narrow angle detection device. However, using an automatic on/off light system set at a preselected radiation threshold level, this system gives excellent repeatability and requires low radiotracer concentrations per injection. The instrumentation is light and portable, and requires no expert supervision. The criteria for selection of the tracer method are speed and convenience rather than high accuracy and precision. However, an accuracy of plus or minus 5 percent can be achieved and the danger from radiation is negligible. (Sandoski-FIRL)
W75-11916

**SAFETY INSTALLATION FOR PREVENTING POLLUTION BY PIPELINES,**
G. F. Wittgenstein.
United States Patent 3,721,270. Issued March 20, 1973. Official Gazette of the United States Patent Office, Vol 908, No 3, p 605-606, March 20, 1973.

Descriptors: *Pipelines, *Safety, Plastics, Instrumentation, Monitoring, Patents, Water pollution control, Pollutant identification, Monitoring.
Identifiers: Detectors, Vessels.

A safety installation for preventing pollution by pipeline is provided with at least one sector equipped with a jacket of plastic material. The jacket surrounding the pipeline is sealed at its ends, with a annular gap formed between the pipeline and its jacket containing a fluid and inserts and spaces. At least one vessel is provided for collecting the evacuated flow and liquid presence detector which gives a warning and remotely controls operations. A fluid-tight hollow space contains a gas under a pressure different from atmospheric pressure and connects the interior of at least one vessel to a crack in the pipe wherever the crack occurs. Instruments permantely monitor the tightness of the space, which compreses at least one perforated gap. Near each vessel is a liquid presence detector and every horizontal run gap of the space is filled with water. The jacket is pierced by at least one perforation, and there is a chimney surrounding the perforation. A channel leads into the chimney above the level of water and to a vessel to form part of the space. Every inclined run gap of the space is perforated at a low point in its jacket, and the channel surrounding the perforation and leading to the vessel forms part of the space. (Sandoski-FIRL)

Water and Sewage Works, Vol 122, No 5, p 94-95, May, 1975.

Descriptors: *Pipes, *Sewerage, Plastic pipes, Construction materials, Clay pipes, Joints(Connection), Infiltration, Costs, Virginia, Waste water treatment.
Identifiers: Armco Truss Pipe, Acrylonitrile-butadiene-styrene.

Kingsmill on the James is a 2900 acre resort and residential development is Virginia. Construction was begun in 1972 and is expected to continue 15 years. One of the earliest construction phases was the placing of electricity, water, sewer and telephone lines underground. Armco Truss Pipe is being installed for the sanitary sewers. The pipe is made by extruding ABS (Acrylonitrile-butadiene-styrene) resin into a truss shape to form an inner and outer wall supported by webs. The voids between the webs are filled with lightweight concrete. The pipe is about three times longer than vitrified clay pipe which allows for fewer joints and faster installation. The joints are solvent welded to reduce infiltration/exfiltration. Separate contracts were signed on four different residential sites in Kingsmill on the James. In each case, the successful contractor bid the Armco pipe substantially lower than the VCP. (Orr-FIRL)

**CREW TRAINING,**
Exxon Co., Houston, Tex.
J. V. Langston.
Drilling, Vol 36, No 7, p 63-65, May, 1975. 4 fig.

Descriptors: *Drilling, *Training, *Labor, *Manpower, Personnel, Schools(Education).
Identifiers: *Driller training, Toolpusher, Derrick man, Rotary helper, Drilling rig crew.

The increasing complexity of drilling operations, a large increase in cost, and the critical shortage of trained people at a time of rapid expansion in the number of drilling rigs are the contributing factors to the greater importance placed on drilling crew training. The article stresses that the level of experience of the average crewman will decrease as a large number of untrained crews are employed in the extending drilling operations. The schools established at the present are good but unable to handle the anticipated volume of training. A plan is suggested that includes a standard test of ability before qualification for promotion. (Bradbeer-NWWA)

British Petroleum Co. Ltd., Sunbury-on-Thames (England). Research Centre.
P. Threadgold.
In: Ninth Commonwealth Mining and Metallurgical Congress 1969, Mining and Petroelum Geology Section, Paper 11, 17 p, 9 fig, 2 tab.

Descriptors: *Boreholes Geophysics, Electrical Logging, *Mining, *Well Logging, *Wells, Aquifer characteristics, Resistivity.
Identifiers: Hydrocarbons, Mining exploration, Sonic log, Formation density, Neutron log, Gamma log, Logging Program Design, Economics.

The development of well-logging in its applications to exploration for hydrocarbons is traced, and it is shown that the interpretation methods used for estimation of porosity in the presence of a multicomponent rock matrix can be used for any multi-component system. The routine logging tools used for porosity estimates are briefly described, and their responses are discussed. Methods of using these tools to resolve problems of mixed lithology are described and illustrated; these methods can be used when the constituents of the rock are known so that their relevant 'logging characteristics' can be defined. The application of other routine logging methods to mining exploration is considered more specifically from a diagnostic viewpoint; however, quantitative use of these measurements in specific areas is not discounted. The design of logging programmes to solve specific problems is described. Various practical problems which have arisen, largely because of the development of well-logging primarily for the petroleum industry, are considered. It is concluded that the technical problems which may well have been responsible for the relatively small use of well logs outside the petroleum industry are no longer insurmountable. A major problem of economics still remains. It is suggested, however, that modern trends in logging justify serious reappraisal of their possible applications to mining exploration. (Campbell-NWWA)

**DISTRIBUTION AND BIOMASS OF MACROPHYTES IN LAKE DGAL MALY,**
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland).
B. Gerlaczynska.
Ekologia Polska, Vol 21, No 48, p 743-752, 1973. 1 fig, 5 tab, 9 ref.

Descriptors: *Distribution, *Lake fisheries, *Biomass, *Aquatic plants, Submerged plants, Floating plants, Chemical properties, Marsh plants, Aquatic weed control, Bulrushes, Cattails, Lakes, Europe, Fish reproduction.
Identifiers: *Lake Dgal Maly(Poland), *Poland, *Macrophytes, Hornwort, Burr-weed, Sedge, Water horsetail, Pondweeds, Schoenoplectus, Water moss, Water weed, Stratiotes aloides.

Macrophyte occurence, distribution, biomass, and their chemical composition in relation to habitat were studied in Lake Dgal Maly, Poland. Vascular flora occupied 4.09 hectares (28.8% of lake area); of this 1.34 hectares or 9.4% were emerged and 2.75 hectares or 19.4% submerged plants. Macrophyte biomass weighed 55.52 tons fresh weight or 12.209 tons dry weight. Fourteen species were found. Phragmites communis (21.6% of total area occupied by littoral plants) was dominant plus 2.4% Typha angustifolia, 3.7% T. latifolia, 2.4% Schoenoplectus sp., and 1.5% Carex sp. Submerged and floating plants consisted of 65.6% Ceratophyllum demersum, 0.8% Fontinalis antypyretica, and 0.5% Stratiotes aloides. C. demersum contained the largest amount of calcium (8.1% of dry mass) and least calcium contents were in Schoenoplectus Tabernaemontani (0.52%). C. demersum contained 0.39% phosphorus and Typha latifolia 0.11%. Typha angustifolia contained 1.84% nitrogen and C. demersum 0.84%. Development of marsh plants limits occurence of underwater meadows and causes deteriorating conditions for phytophilous fish reproduction. Mowing must be done every few years to limit helophyte development. (Buchanan-Davidson–Wisconsin)

Polish Academy of Sciences, Warsaw. Inst. of Ecology.
Z. Kajak, and J. Zawisza.
Ekologia Polska, Vol 21, No 41, p 632-642, 1973. 8 tab, 26 ref.

Descriptors: *Fish stocking, *Lakes, *Biological communities, *Fish diets, Aquatic plants, Carp, Pikes, Perches, Phytoplankton, Zooplankton, Nannoplankton, Productivity, Biomass, Herbivores, Fecundity, Juvenile fish, Fish parasites, Growth rates, Benthos, Europe.
Identifiers: *Lake Warniak(Poland), *Poland, Roach, Tench, Bream.

eview of previous research shows that in-uction of fish, primarily carp, into Lake War-, Poland from 1967-1969 caused phytoplank-biomass and production to decrease and or-c matter decomposition and nannoplankton ass to increase. Small zooplankton species in-sed, but biomass and productivity of large ies decreased. Dominant zooplankton species uced 2-10 times more eggs and body length in-sed up to 37%. Increasing fish pressure eased the benthos level without changing its mics. Where fish pressure was high, faunal ass associated with macrophytes and the age individual weight was smaller. Spatial dis-ution of pike, roach, perch, and most juvenile forms did not change. Young carp were used od by bigger pike, but carp did not gather on vning grounds of roach, tench, and crucian or feed on their spawn and larvae. Carp were cted by Trichodina, Dactylogyrus vastator, D. oratus, and Ergasilus sieboldi and an acute icaemia. Growth rates of fish decreased from to 1969, but increases in carp and bream body ght were generally high and their conditions factory due to better utilization of smaller unts of consumed food. Fish pressure corre-l with the decrease of benthos biomass. chanan-Davidson--Wisconsin)

**PRAIRIE POTHOLE ECOLOGY AND THE FEASIBILITY OF GROWING RAINBOW TROUT (SALMO GAIRDNERI RICHARDSON) IN PRAIRIE POTHOLES,**
North Dakota State Univ., Fargo. Dept. of Zoology.
G. L. Myers.
MS thesis, May 1973. 98 p. 19 fig, 11 tab, 34 ref.

Descriptors: *Potholes, *North Dakota, *Fish farming, *Rainbow trout, *Fish food organisms, Mortality, Fish stocking, Salmonids, Oxygen sag, Lake morphology, Chemical properties, Phytoplankton, Zooplankton, Invertebrates, Growth rates, Water levels, Winterkilling, Benthic fauna, Salamanders, Mercury, Diptera, Amphipods, Water temperature, Alkalinity, Phosphates, Nitrogen compounds, Hardness(Water), Specific conductivity, Costs, Eutrophication, Copepods, Daphnia, Fish harvest, Water pollution effects, Rooted aquatic plants, Waterfowl, Competition.
Identifiers: *Prairie pothole lakes.

Commercial rainbow trout production is not feasible in four North Dakota pothole lakes studied, although trout growth did reach commercial size in one season. Mortality was due to a combination of factors: initial stocking mortality, diurnal dissolved oxygen fluctuations, water temperature, ammonia toxicity, and bird predation. Trout ate the same foods as salamanders but in different proportions. Trout consumed amphipods, Chaoborus, and chironomids. They selected Chaoborus when present, then relied on amphipods. Competition with waterfowl for food was not demonstrated. Nitrogen was the limiting nutrient in three lakes; the fourth lake had high nitrogen and ortho-phosphate levels due to a septic tank discharge. Density of rooted vegetation, Ceratophyllum demersum and Myriophyllum exalbescens, appeared to have a negative correlation with blue-green algae blooms. If an algal bloom occured early in the season, rooted vegetation was stunted; otherwise Ceratophyllum dominated. In three lakes the dominate algae was Aphanizomenon. Succession from Anabaena to Aphanizomenon to Microcystis was observed. Daphnia were the most numerous zooplankters. Copepod populations often followed fluctuations in Daphnia. Benthic invertebrates consisted of amphipods and chironomids. The number of oligochaetes appeared to increase, relative to chironomids, as organic enrichment increased. (Buchanan-Davidson-Wisconsin).

## 10C. Secondary Publication And Distribution

**MINE DRAINAGE ABSTRACTS, A BIBLIOGRAPHY. 1972 SUPPLEMENT.**
Bituminous Coal Research, Inc., Monroeville, Pa.
For primary bibliographic entry see Field 5B.
W75-12158

**INTERNATIONAL ECONOMICS AND ENVIRONMENT CONTROL,**
Southampton Univ. (England). Dept. of Economics.
For primary bibliographic entry see Field 6G.
W75-12178

**EXTERNALITIES AND PUBLIC GOODS. A BIBLIOGRAPHY,**
Warwick Univ., Coventry (England). Dept. of Economics.
For primary bibliographic entry see Field 6B.
W75-12179

**RECREATION ANALYSIS. A BIBLIOGRAPHY,**
Birmingham Univ. (England). Dept. of Transportation and Environmental Planning.
For primary bibliographic entry see Field 6B.
W75-12180

**FISHERIES ECONOMICS. A BIBLIOGRAPHY,**
Manchester Univ. (England). Dept. of Agricultural Economics.
For primary bibliographic entry see Field 3E.
W75-12181

**ECONOMIC GROWTH VS. THE ENVIRONMENT. A BIBLIOGRAPHY,**
Bristol Univ. (England). Dept. of Economics.
For primary bibliographic entry see Field 6G.
W75-12182

**THE FIFTH ANNUAL REPORT OF THE COUNCIL ON ENVIRONMENTAL QUALITY.**
Council on Environmental Quality, Washington, D. C.
For primary bibliographic entry see Field 6G.
W75-12203

**THE LAW OF THE SEA: A SELECTIVE BIBLIOGRAPHY OF ARTICLES, DOCUMENTS AND MONOGRAPHS,**
Columbia Univ., New York. School of Law.
For primary bibliographic entry see Field 06E.
W75-12217

## 10F. Preparation Of Reviews

**POLLUTION EFFECTS ON SURFACE WATERS AND GROUNDWATERS,- (LITERATURE REVIEW),**
Hawaii Univ., Honolulu. Dept. of Civil Engineering.
For primary bibliographic entry see Field 05B.
W75-12070

**ORGANICS, (LITERATURE REVIEW),**
Drexel Univ., Philadelphia, Pa. Dept. of Environmental Engineering and Science.
For primary bibliographic entry see Field 05B.
W75-12071

**INORGANICS, (LITERATURE REVIEW),**
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
For primary bibliographic entry see Field 05A.
W75-12072

**WATER CHARACTERISTICS, (LITERATURE REVIEW),**
Maine Univ. Orono.
For primary bibliographic entry see Field 05A.
W75-12073

**ANAEROBIC PROCESSES, (LITERATURE REVIEW),**
Institute of Gas Technology, Chicago, Ill.
For primary bibliographic entry see Field 05D.
W75-12074

**SLUDGE TREATMENT, UTILIZATION, AND DISPOSAL, (LITERATURE REVIEW),**
Delaware Univ., Newark. Dept. of Civil Engineering.
For primary bibliographic entry see Field 05D.
W75-12075

**WASTEWATER COLLECTION, (LITERATURE REVIEW),**
Nottingham (H.D.) and Associates, Inc., McLean, Va.
For primary bibliographic entry see Field 05D.
W75-12076

**WEATHER MODIFICATION: WHERE ARE WE NOW AND WHERE SHOULD WE BE GOING. AN EDITORIAL OVERVIEW,**
National Hurricane and Experimental Meteorology Lab., Coral Gables, Fla.
For primary bibliographic entry see Field 03B.
W75-12088

# SUBJECT INDEX

**PROJECTS**
Resources Programs in the Southeastern
1960 9D

of 2,4-D and Various Salts on Eurasian
nilfoil.
1990 4A

**OBIC CONDITIONS**
sk of Deoxygenation of Water in Herbi-
pplication for Aquatic Weed Control,
1996 5A

**TE LIABILITY**
y for Oil Pollution Disasters: Interna-
Law and the Delimitation of Com-
es in a Federal Policy,
2235 5G

**TION**
ptake and Utilization of Organic Carbon
ae: An Essay in Comparative Biochemis-
1980 5C

lving the Flow Equation in Unsaturated
y Optimization: Horizontal Infiltration,
2083 2G

cal Investigation of the Relation
en Absorbability and Content of Grain-
actions and Humus, (In Russian),
2344 2G

**CTS**
Drainage Abstracts, A Bibliography. 1972
ment.
2158 5B

**ION (LEGAL ASPECTS)**
ederal Common Law of Accretion: A
lement in Property Law,
2205 6E

oir Properties Affecting Matrix Acid
tion of Sandstones,
894 4B

**ACTURING**
ffect of Surface Kinetics in Fracture
ng,
887 8B

**NE WATER**
ine Drainage in Cane Creek Basin, Near
n, Walker County, Alabama,
871 5G

**TUAL SOLVENT (AMS) TECHNIQUE**
Look at Sandstone Acidizing,
878 4B

**REAMS**
ine Drainage in Cane Creek Basin, Near
n, Walker County, Alabama,
871 5G

**WATER**
ine Drainage in Cane Creek Basin, Near
n, Walker County, Alabama,
871 5G

ffect of Surface Kinetics in Fracture
ng,
887 8B

Thermodynamic and Kinetic Aspects of Argillaceous Sandstone Acidizing,
W75-11891 4B

Experimental Data for Establishing the Content of Alpha, Alpha, Beta-Trichloropropionic Acid and its Sodium Salts in Reservoir Water,
W75-12190 5C

**ACOUSTICS**
How Downhole Temperatures, Pressures Affect Drilling, Part 3, Overpressure Detection from Wireline Methods,
W75-11867 8C

**ACTIVATED CARBON**
Adsorption of Poliovirus onto Activated Carbon in Wastewater,
W75-12148 5D

**ACTIVATED SLUDGE**
Primary Developments of Air-Borne Bacteria in the OECD Activated Sludge System,
W75-12143 5D

Biological Waste Water Treatment,
W75-12149 5D

The Relationship Between Process Configuration and Process Performance,
W75-12152 5D

Principles and Techniques for Conditioning of Waste-Activated Sludge by Direct Slurry Freezing,
W75-12154 5D

The Influence of Oxygen Concentration and Turbulence Intensity on Complete-Mix Activated Sludge Performance,
W75-12155 5D

New Orleans Chooses Oxygen Activated Sludge.
W75-12318 5D

Biologically Mediated Inconsistencies in Aeration Equipment Performace,
W75-12333 5D

Recent Developments of Instrumentation, Control and Automation Systems for Wastewater Treatment Systems,
W75-12341 5D

**ADJACENT LAND OWNERS**
Gumz V. Bejes (Action by Adjoining Landowners for Injunction Against Flooding From Drainage and Irrigation Ditch).
W75-12290 6E

Gulf Shore Seafood and Company v. Cities Service Co. (Action for Damages Arising from Dam Break of Phosphate Company's Dam Permitting Phosphate Slime Pollution of River).
W75-12291 6E

Wildwood Estates of Braintree, Inc. v. Smith (Action to Determine Prescriptive Rights of Use in Defendant's Pond).
W75-12292 6E

**ADJACENT LANDOWNERS**
Borgmann V. Florissant Development Co (Action to Enjoin Adjoining Property Owners From Collecting and Discharging Surface Water onto Plaintiffs' Land).
W75-12289 6E

**ADJUDICATION PROCEDURE**
Uses of Scientific Information in Environmental Decision-Making,
W75-12204 6G

**ADMINISTRATION**
Liaison with Planning Authorities-A Vital Link,
W75-12335 6E

**ADMINISTRATIVE ACCOUNTABILITY**
Colorado Public Interest Research Group, Inc. V. Train (Citizen Suit to Compel the Environmental Protection Agency to Control Discharge or Radioactive Materials into Navigable Waters).
W75-12287 6E

**ADMINISTRATIVE AGENCIES**
Ocean Dumping Oversight.
W75-12194 5G

Federal Ocean Programs Review.
W75-12200 6E

The Fifth Annual Report of the Council on Environmental Quality.
W75-12203 6G

The Doctrine of Primary Jurisdiction Misconceived: End to Common Law Environmental Protection,
W75-12206 6G

Water Quality Management Basin Plans--Policies and Procedures.
W75-12260 5G

Marine Sanctuaries.
W75-12261 6E

Estuarine Sanctuary Grants--Application and Selection Criteria Procedures.
W75-12262 6E

Permits for Activities in Navigable Waters or Ocean Waters.
W75-12263 6E

Iron and Steel Manufacturing Point Source Category--Effluent Guidelines and Standards.
W75-12264 5G

Canned and Preserved Seafood Processing Point Source Category--Effluent Limitations Guidelines.
W75-12265 5G

Fertilizer Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Limitations.
W75-12266 5G

Timber Products Processing Point Source Category--Effluent Guidelines and Standards.
W75-12267 5G

Organic Chemicals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Application to Pretreatment Standards.
W75-12268 5G

Soap and Detergent Manufacturing Point Source Category--Effluent Limitations Guidelines.
W75-12269 5G

Grain Mills Point Source Category--Effluent Limitations Guidelines and Standards.
W75-12274 5G

**ADMINISTRATIVE AGENCIES**

Plastics and Synthetic Point Source Category--Effluent Guidelines and Standards.
W75-12275 5G

Nonferrous Metals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Limitations.
W75-12276 5G

Conservation Soc'y. of Southern Vermont, Inc. V. Secretary of Transportation (Review of Motion for Equitable Injunction Against Stream Channelization Project).
W75-12282 6E

Train V. City of New York (Class Action by City to Compel EPA to Allot Funds Authorized by the 1972 Federal Water Pollution Control Act Amendments).
W75-12284 6E

Train V. Campaign Clean Water, Inc. (Action by Environmental Group to Require EPA to Release Funds Authorized for Federal Grants to Municipalities for Water Pollution Control.
W75-12285 6E

**ADMINISTRATIVE DECISIONS**

The Doctrine of Primary Jurisdiction Misconceived: End to Common Law Environmental Protection,
W75-12206 6G

**ADMINISTRATIVE REGULATIONS**

The Florida Environmental Protection Act of 1971: The Citizen's Role in Environmental Management,
W75-12207 6G

Water Quality Management Basin Plans--Policies and Procedures.
W75-12260 5G

Marine Sanctuaries.
W75-12261 6E

Estuarine Sanctuary Grants--Application and Selection Criteria Procedures.
W75-12262 6E

Permits for Activities in Navigable Waters or Ocean Waters.
W75-12263 6E

Iron and Steel Manufacturing Point Source Category--Effluent Guidelines and Standards.
W75-12264 5G

Canned and Preserved Seafood Processing Point Source Category--Effluent Limitations Guidelines.
W75-12265 5G

Fertilizer Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Limitations.
W75-12266 5G

Timber Products Processing Point Source Category--Effluent Guidelines and Standards.
W75-12267 5G

Organic Chemicals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Application to Pretreatment Standards.
W75-12268 5G

Soap and Detergent Manufacturing Point Source Category--Effluent Limitations Guidelines.
W75-12269 5G

Meat Products Point Source Category--Effluent Guidelines and Standards.
W75-12273 5G

Grain Mills Point Source Category--Effluent Limitations Guidelines and Standards.
W75-12274 5G

Plastics and Synthetic Point Source Category--Effluent Guidelines and Standards.
W75-12275 5G

Nonferrous Metals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Limitations.
W75-12276 5G

**ADSORPTION**

Adsorption of Poliovirus onto Activated Carbon in Wastewater,
W75-12148 5D

**AERATION**

Single Basin Aerated Sewage Lagoon with Spring Time Intensified Aeration,
W75-12060 5D

Method of Treating Sewage to Enhance Aerobic Decomposition,
W75-12061 5D

Aerobic Sewage Treatment System,
W75-12063 5D

Biologically Mediated Inconsistencies in Aeration Equipment Performace,
W75-12333 5D

Aeration Upgrades Reservoir,
W75-12346 5F

**AERIAL PHOTOGRAPHY**

Deciphering of Ground Water from Aerial Photographs,
W75-11882 4B

Photographic Quantification of Water Quality in Mixing Zones,
W75-11970 5A

**AEROBIC BACTERIA**

Microbiology of a Former Dredge Spoil Disposal Area,
W75-12191 5C

**AEROBIC DECOMPOSITION**

Method of Treating Sewage to Enhance Aerobic Decomposition,
W75-12061 5D

**AEROBIC DIGESTION**

Refrigerated Surge Tank for Use With Aerobic Sewage Digestion System,
W75-11930 5D

**AEROBIC TREATMENT**

Method of Treating Sewage to Enhance Aerobic Decomposition,
W75-12061 5D

Aerobic Sewage Treatment System,
W75-12063 5D

The Effects of Aerobic and Anaerobic Incubation on the Extractabilities of Heavy Metals in Digested Sewage Sludge,
W75-12330 5D

**AEROSOLS**

Relative Throughfall Enrichment by Biologic and by Aerosol-Derived Materials in Loblolly Pines,
W75-11853 5B

**AFRICA**

Control of Groundwater at Bancroft Mines, Zambia,
W75-12395 4B

**AGRICULTURAL CHEMICALS**

Draft Proposal for Legislation to Control Water Pollution from Agricultural Sources,
W75-12213 5G

**AGRICULTURAL RUNOFF**

Draft Proposal for Legislation to Control Water Pollution from Agricultural Sources,
W75-12213 5G

**AGRICULTURAL WATERSHEDS**

Water Bank Program.
W75-12259 6E

**AIR POLLUTION**

Environmental Research Laboratories, 1973 Annual Report.
W75-12033 5A

Lidar vs. Photometer, A One Month Comparison,
W75-12036 5A

Application of a Simple Dispersion Model to a Rural Industrial Region,
W75-12037 5A

The Simple ATDL Urban Air Pollution Model,
W75-12038 5A

Diffusion Estimation for Small Emissions,
W75-12039 5A

**AIR-WATER INTERFACES**

The Floating Cover: Best Way to Cover a Finished-Water Reservoir,
W75-12360 5F

**AIRPORTS**

Environmental Water Quality Program,
W75-12331 5G

**ALABAMA**

Acid Mine Drainage in Cane Creek Basin, Near Oakman, Walker County, Alabama,
W75-11871 5G

The Water Pollution Permitting System,
W75-12245 5G

**ALASKA**

A Preliminary Study of the Formation of Landfast Ice at Barrow, Alaska, Winter 1973-74,
W75-12162 2C

Water-Quality Data, 1948-73, Anchorage and Vicinity, Alaska,
W75-19955 5A

**ALASKE**

Cook Inlet Tidal Stream Atlas,
W75-12163 2L

**ALBERTA**

Evaluating the Productivity of Pine Forests in the Hinton-Edson Area, Alberta, From Soil Survey Maps,
W75-12003 4A

**ALGAE**

Effects of the Commercial Polychlorinated Biphenyl Mixture Aroclor 1242 on Growth, Viability, Phosphate Uptake, Respiration and Oxygen Evolation in Scenedesmus,
W75-11974 5C

Response of Lake Superior Algae to Nutrients and Taconite Tailings,
W75-11976 5C

e Uptake and Utilization of Organic Carbon Algae: An Essay in Comparative Biochemis-
75-11980 5C

docytosis of Microcystis Aeruginosa by hromonas Danica,
75-11985 5C

e Utilization of Phosphorus from Muds by Phytoplankter, Scenedesmus Dimorphus, l the Significance of These Findings to the ctice of Pond Fertilization,
75-11986 5C

tergent Phosphorus and Algal Growth,
75-12001 5C

74 Annual Report of the Freshwater Biologi- Investigation Unit.
75-12008 5C

owth of the Green Alga Codium Fragile in a nnecticut Estuary,
5-12051 5C

rogen, Phosphorus, and Eutrophication in Coastal Marine Environment,
5-12236 5C

**AL CONTROL**
docytosis of Microcystis Aeruginosa by hromonas Danica,
5-11985 5C

Chemicals Used Algae Control degradable.
5-12325 5C

oxy Resin Application at Sewage Works.
5-12349 5D

**CIDES**
Chemicals Used Algae Control degradable.
5-12325 5C

**ALIS (BASES)**
ium Hydroxide Treatment of Acid Mine inage,
5-12116 5G

**TMENTS**
in V. City of New York (Class Action by to Compel EPA to Allot Funds Authorized the 1972 Federal Water Pollution Control Amendments).
5-12284 6E

**RATION OF FLOW**
es of Supply of Nitrogen and Phosphorus to e Winnipeg, Manitoba, in Relation to the ersion of Missouri River Water Into the Red Assiniboine Rivers,
5-12006 5C

**ONIUM COMPOUNDS**
ilizer Manufacturing Point Source Catego- Effluent Limitations and Guidelines.
5-12272 5G

**ONIUM IODIDE**
Explanation for the Unusual Nucleating ity of Aerosols Produced from the AgI- II-Acetone System,
5-12100 3B

**ROBIC CONDITIONS**
erobic Processes, (Literature Review),
5-12074 5D

**ROBIC DIGESTION**
erobic Processes, (Literature Review),
5-12074 5D

**ANAEROBIC TREATMENT**
The Effects of Aerobic and Anaerobic Incubation on the Extractabilities of Heavy Metals in Digested Sewage Sludge,
W75-12330 5D

**ANAEROBIOSIS**
Filtration of Neutral Red by Fresh Water Clams in Aerobic and Hypoxic Conditions,
W75-12192 5C

**ANALYTICAL TECHNIQUES**
Observations on the Atomic Absorption Behavior of Some of the Earth Elements,
W75-11862 5A

Combined Wastewater Overflows,
W75-11912 5D

A Mobile Sprinkler Irrigation Facility for Measurement of Surface Runoff and Soil Erosion (Eine Transportable Beregnungsanlage fuer die Messung von Oberflaechenabfluss und Bodenabtrag),
W75-11948 7B

Photographic Quantification of Water Quality in Mixing Zones,
W75-11970 5A

Biological and Chemical Mechanisms in Eutrophication of Freshwater Lakes,
W75-11992 5C

Analysis of Heavy Metals in Sewage Sludge and Liquids Associated with Sludges,
W75-12140 5A

The Impact of Chemical Pollution on Water Utilizationnutzung),. (Chemische Gewaesserverunreinigung und Wasser
W75-12314 5B

Application of the Methylthymol Blue Sulfate Method to Water and Wastewater Analysis,
W75-12324 5A

**ANCHORAGE (ALASKA)**
Water-Quality Data, 1948-73, Anchorage and Vicinity, Alaska,
W75-19955 5A

**ANIMAL PHYSIOLOGY**
Filtration of Neutral Red by Fresh Water Clams in Aerobic and Hypoxic Conditions,
W75-12192 5C

**ANNUAL FLOOD**
Stochastic Hydrologic Systems,
W75-12015 2A

**APALACHICOLA BAY (FLA)**
Estimation of Hurricane Storm Surge in Apalachicola Bay, Florida,
W75-12164 2B

**APPROPRIATION**
A Proposal for the Quantification of Reserved Indian Water Rights,
W75-12249 6E

**AQUATIC ANIMALS**
Experimentally Increased Fish Stock in the Pond Type Lake Warniak. XIII. Distribution and Biomass of the Lemnaceae and the Fauna Associated with Them,
W75-12009 8I

Toxicity of Aquatic Organisms Caused by Chlorination,
W75-12353 5D

**AQUATIC LIFE**
Toward a Cleaner Aquatic Environment,
W75-12234 5G

Marine Sanctuaries.
W75-12261 6E

**AQUATIC PLANTS**
Distribution of Aquatic Macrophytes Related to Paper Mill Effluents in a Southern Michigan Stream,
W75-11991 2B

Distribution and Biomass of Macrophytes in Lake Dgal Maly,
W75-11993 8I

Experimentally Increased Fish Stock in the Pond Type Lake Warniak. XIII. Distribution and Biomass of the Lemnaceae and the Fauna Associated with Them,
W75-12009 8I

Floating Aquatic Plants Remove Chemicals From Polluted Waters.
W75-12145 5G

**AQUATIC VEGETATION**
Aquatic Weed Control - State Revenue Laws.
W75-12295 6E

**AQUATIC WEED CONTROL**
Effect of 2,4-D and Various Salts on Eurasian Watermilfoil.
W75-11990 4A

The Risk of Deoxygenation of Water in Herbicide Application for Aquatic Weed Control,
W75-11996 5A

Aquatic Weed Control - State Revenue Laws.
W75-12295 6E

**AQUATIC WEEDS**
Aquatic Weed Control - State Revenue Laws.
W75-12295 6E

**AQUIFER CHARACTERISTICS**
Land Subsidence in the San Joaquin Valley, California, as of 1972,
W75-11956 4B

Ground-Water Basic Data for Emmons County, North Dakota,
W75-11963 4B

**AQUIFER SYSTEMS**
Land Subsidence Due to Ground-Water Withdrawal in the Los Banos-Kettleman City Area, California, Part 3. Interrelations of Water-Level Change, Change in Aquifer-System Thickness, and Subsidence,
W75-11958 4B

**AQUIFER TESTING**
Well Storage,
W75-12390 8B

**ARANSAS BAY (TEXAS)**
Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

**ARIZONA**
A Study of Flash-Flood Susceptibility -- A Basin in Southern Arizona,
W75-12167 4A

Flood Plain Information: Hassayampa River, Vicinity of Wickenburg, Arizona.
W75-12370 4A

ARKANSAS RIVER BASIN
Surface Water Supply of the United States, 1966-70: Part 7. Lower Mississippi River--Volume 2. Arkansas River Basin.
W75-11969 7C

AROCLORS
Effects of the Commercial Polychlorinated Biphenyl Mixture Aroclor 1242 on Growth, Viability, Phosphate Uptake, Respiration and Oxygen Evolation in Scenedesmus,
W75-11974 5C

ARTIFICIAL PRECIPITATION
Florida Area Cumulus Experiments 1970-1973 Rainfall Results,
W75-12091 3B

Hail Suppression Data from Western North Dakota, 1969-1972,
W75-12094 3B

Analysis of Radar Observations of a Randomized Cloud Seeding Experiment,
W75-12101 3B

Potential of Precipitation Modification in Moderate to Severe Droughts,
W75-12110 2B

ARTIFICIAL RECHARGE
Artificial Groundwater Recharge, I. Circular Recharging Area,
W75-12040 4B

Artifical Groundwater Recharge, II. Rectangular Recharging Area,
W75-12097 4B

ASIA
Observations of the Guppy, Poecilia Reticulata Peters, in Culex Pipiens Fatigans Breeding Sites in Bangkok, Rangoon, and Taipei,
W75-11989 5G

ASSESSMENT
The Assessment of Water Quality,
W75-12054 5F

ATMOSPHERE
Federal Ocean Programs Review.
W75-12200 6E

ATMOSPHERIC PRESSURE
Diurnal Fluctuations of Water Tables Induced by Atmospheric Pressure Changes,
W75-12077 2G

ATMOSPHERIC SOUNDINGS
On the Variability of 'Dynamic Seedability' as a Function of Time and Location Over South Florida: Part I. Spatial Variability,
W75-12089 3B

ATOMIC ABSORPTION SPECTROMETRY
Observations on the Atomic Absorption Behavior of Some of the Earth Elements,
W75-11862 5A

ATTITUDES
The Assessment of Water Quality,
W75-12054 5F

AUSTIN (TEX)
Flood Plain Information: Onion Creek, Austin, Texas.
W75-12374 4A

AUTOMATION
Water Plant goes Automatic,
W75-12345 8C

AVON HARBOR (NC)
A Mini-Project for Avon Harbor, North Carolina,
W75-12045 8A

BACTERIA
Studies on Metabolic Activity of Benthic Bacteria Isolated from Three Lakes,
W75-11988 5C

The Bacterial Quality of Bottled Water,
W75-12011 5F

Influence of Environmental Stress on Enumeration of Indicator Bacteria from Natural Waters,
W75-12053 5C

Primary Developments of Air-Borne Bacteria in the OECD Activated Sludge System,
W75-12143 5D

Microbiology of a Former Dredge Spoil Disposal Area,
W75-12191 5C

Clearwell Quality Doesn't Last,
W75-12340 5F

Bacterial Processes for Improved Oil Recovery.
W75-12391 2F

BARBEL ZONE (STREAMS)
The Ichthyofauna of the Rokytna River: I. Species Composition, Abundance and Biomass,
W75-12129 2I

BARDENFO PROCESS
Nutrient Removal in Biological Systems,
W75-12321 5D

BARRIER ISLANDS
Emigration of the Peamouth Chub, Mylocheilus Caurinus, Across a Dilute Seawater Bridge: An Experimental Zoogeographic Study,
W75-12151 2L

BASELINE STUDIES
Limnology of Lakes of the Sylvania Recreation Area, Ottawa National Forest,
W75-11981 2H

BASIC DATA COLLECTION
Ground-Water Basic Data for Emmons County, North Dakota,
W75-11963 4B

BASIC DATA COLLECTIONS
Water Resources Data for California, 1973: Part 2. Water Quality Records.
W75-11962 7C

Quality of Surface Waters of the United States, 1970: Part 8. Western Gulf of Mexico Basins.
W75-11965 7C

Quality of Surface Waters of the United States, 1969: Part 8. Western Gulf of Mexico Basin.
W75-11966 7C

Surface Water Supply of the United States, 1966-70: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins - Volume 3. Basins from Apalachicola River to Pearl River.
W75-11967 7C

Surface Water Supply of the United States, 1966-70: Part 6. Missouri River Basin--Volume 1. Missouri River Basin above Williston, North Dakota.
W75-11968 7C

Surface Water Supply of the United States, 1966-70: Part 7. Lower Mississippi River--Volume 2. Arkansas River Basin.
W75-11969 7C

Hydrogeologic Data for the Lower Connecticut River Basin, Connecticut,
W75-19954 7C

Water-Quality Data, 1948-73, Anchorage and Vicinity, Alaska,
W75-19955 5A

BAYESIAN METHODOLOGY
A Bayesian Framework for the Use of Regional Information in Hydrology,
W75-12048 6A

BAYS
Oceanographic Observations in the Georgia Bight: Data Report for R.V. EASTWARD Cruises E-13-73 (4-11 September) and E-19-73 (8-9 December 1973),
W75-12169 2L

BEACH DEVELOPMENT
City of Lake Charles; Reclamation and Development of Lake Front.
W75-12298 6E

BEACH EROSION
Introduction of Shore Erosion Control Legislation.
W75-12279 6E

BEACH FRONT HOTELS
Tarshis v. Lahaina Investment Corp. (Responsibility of Owner of Beach Front Property to Warn of Surging Wave).
W75-12296 6E

BEACHES
Small Groins on the Shores of Long Island Sound,
W75-12046 8A

BEAMHOUSE LIQUORS
Some Aspects of a Chemical Treatment of the Waste Waters from the Beamhouse,
W75-12120 5D

BEDS UNDER WATER
Basic Principles Relating to the International Regime of the Oceans at the Caracas Session of the U. N. Law of the Sea Conference,
W75-12253 6E

Submerged Lands (State Title to Certain Submerged Lands).
W75-12288 6E

BEET SUGAR
Beet Sugar Processing Point Source Subcategory--Effluent Guidelines and Standards.
W75-12271 5G

BELGIAN COAST
Dispersion and Settling Around a Waste Disposal Point in a Shallow Sea,
W75-12043 5B

BENDING LOAD
Graphical Method Speeds Deviated Well Casing Design,
W75-11896 8G

BENTHIC FAUNA
Impact of Intracoastal Waterway Maintenance Dredging on a Mud Bottom Benthos Community,
W75-12189 5C

ERING SEA
Major Late-Winter Features of Ice in Northern Bering and Chukchi Seas as Determined From Satellite Imagery,
W75-12168 2C

BLIOGRAPHIES
Organics, (Literature Review),
W75-12071 5B

Inorganics, (Literature Review),
W75-12072 5A

Water Characteristics, (Literature Review),
W75-12073 5A

Anaerobic Processes, (Literature Review),
W75-12074 5D

Sludge Treatment, Utilization, and Disposal, (Literature Review),
W75-12075 5D

Wastewater Collection, (Literature Review),
W75-12076 5D

Mine Drainage Abstracts, A Bibliography. 1972 Supplement.
W75-12158 5B

Input-Output Analysis and the Environment,
W75-12177 6G

International Economics and Environment Control,
W75-12178 6G

Externalities and Public Goods. A Bibliography,
W75-12179 6B

Recreation Analysis. A Bibliography,
W75-12180 6B

Fisheries Economics. A Bibliography,
W75-12181 3E

Economic Growth Vs. the Environment. A Bibliography,
W75-12182 6G

O-OXIDATION
Bio-Oxidation Process Saves H20,
W75-12115 5D

O-PAC PROCESS
Biological Waste Water Treatment,
W75-12149 5D

OASSAY
Nitrogen, Phosphorus, and Eutrophication in he Coastal Marine Environment,
W75-12236 5C

OCHEMICAL OXYGEN DEMAND
A Comparison of the Methods Used to Calcute First Order BOD Equation Constants,
W75-11855 5B

OCHEMISTRY
he Uptake and Utilization of Organic Carbon y Algae: An Essay in Comparative Biochemisy,
W75-11980 5C

iltration of Neutral Red by Fresh Water lams in Aerobic and Hypoxic Conditions,
W75-12192 5C

ODEGRADATION
tudies of Prevention of Water Pollution, III. n the Biodegradation of Synthetic Detergents, n Japanese),
W75-12316 5B

Are Chemicals Used Algae Control Biodegradable.
W75-12325 5C

BIOINDICATORS
Influence of Environmental Stress on Enumeration of Indicator Bacteria from Natural Waters,
W75-12053 5C

Some Microbiological Aspects of the Land Disposal of Sludge,
W75-12138 5D

The Mussel Watch--A First Step in Global Marine Monitoring,
W75-12187 5B

BIOLOGICAL COMMUNITIES
Experimentally Increased Fish Stock in the Pond Type Lake Warniak. XIV. The Relations Between the Fish and Other Biocenotic Components (Summing Up the Studies),
W75-11998 8I

BIOLOGICAL PROPERTIES
Biological and Chemical Mechanisms in Eutrophication of Freshwater Lakes,
W75-11992 5C

BIOLOGICAL TREATMENT
Package Treatment Plants and Factors Affecting Service,
W75-11857 5D

Nitrogen Removal from Municipal Wastewater,
W75-11859 5D

Bio-Oxidation Process Saves H20,
W75-12115 5D

Biological Waste Water Treatment,
W75-12149 5D

Nutrient Removal in Biological Systems,
W75-12321 5D

BIOMASS
Distribution and Biomass of Macrophytes in Lake Dgal Maly,
W75-11993 8I

Experimentally Increased Fish Stock in the Pond Type Lake Warniak. VI. Biomass and Production of Phytoplankton,
W75-12013 5C

The Ichthyofauna of the Rokytna River: I. Species Composition, Abundance and Biomass,
W75-12129 2I

Effect of Bromex-50 on Plankton Population in Fish Ponds,
W75-12188 5C

BLUE CRABS
Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

BOD RATE CONSTANTS
A Comparison of the Methods Used to Calculate First Order BOD Equation Constants,
W75-11855 5B

BONNEVILLE SALT FLATS
Diurnal Fluctuations of Water Tables Induced by Atmospheric Pressure Changes,
W75-12077 2G

BOREHOLE GEOPHYSICS
How Downhole Temperatures, Pressures Affect Drilling, Part 9, Navel Ways to Detect Abnormal Pressure,
W75-11868 8C

Hole-to-Hole Geophysical Measurement Research for Mineral Exploration,
W75-11873 8G

Recent Application of Geophysical Methods in Coal Mining,
W75-12396 8B

BOREHOLES GEOPHYSICS
Application of Well Logging Techniques to Mining Exploration Boreholes,
W75-12398 8G

BOTTLED WATER
The Bacterial Quality of Bottled Water,
W75-12011 5F

BOTTOM ORGANISMS
Studies on Metabolic Activity of Benthic Bacteria Isolated from Three Lakes,
W75-11988 5C

BOUNDARIES (PROPERTY)
The Federal Common Law of Accretion: A New Element in Property Law,
W75-12205 6E

BOUNDARY LAYERS
An Infra-Red Psychrometer for Detecing Changes in the Humidity of Leaf Boundary Layers,
W75-12131 2I

BOUNDARY PROCESSES
Simulation of the Short-Time Scour-Fill Process in Erodible Streams with Stochastic Sediment Transfer at the Stream Bed,
W75-12029 2J

BRINE DISPOSAL
Specialized Underground Extraction Systems.
W75-12388 8B

BRINES
Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

BRITISH COLUMBIA
Municipal Sewage Treatment to Protect Shellfish Growing Waters,
W75-12352 5D

BROWN SHRIMP
Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

BUCKLEY-LEVERETT MODEL
Displacement Stability of Water Drives in Water-Wet Connate-Water-Bearing Reservoirs,
W75-11870 4B

BUCKLING
Graphic Solutions to Tubing Movement in Deep Wells,
W75-11875 8B

BULLHEADS
Seasonal Prevalence of Chondrococcus Columnaris Infection in Black Bullheads from Clear Lake, Iowa,
W75-11995 5C

**BULLHEADS**

Daily Fall Activity and Direction of Movements of Fish in Lake Quenouille in the Laurentians, (In French),
W75-12064 2H

**BYPASSES**
Inflatable Plug Cuts Mess, Cleanup on Sewerline ByPass,
W75-11908 8C

**CADMIUM**
Chemical Tests for Plant Available Metals in Soils.
W75-12142 5A

**CALCITE**
Studies in the System CaCO:-FeCO3: 1. Phase Relations; 2. A Method for Major-Element Spectrochemical Analysis; 3. Compositions of Some Ferroan Dolomites,
W75-12400 2F

**CALIFORNIA**
Land Subsidence in the San Joaquin Valley, California, as of 1972,
W75-11956 4B

Land Subsidence Due to Ground-Water Withdrawal in the Los Banos-Kettleman City Area, California, Part 2. Subsidence and Compaction of Deposits,
W75-11957 4B

Land Subsidence Due to Ground-Water Withdrawal in the Los Banos-Kettleman City Area, California, Part 3. Interrelations of Water-Level Change, Change in Aquifer-System Thickness, and Subsidence,
W75-11958 4B

Water Resources Data for California, 1973: Part 2. Water Quality Records.
W75-11962 7C

Formation of Graupel,
W75-12093 3B

Interim Report, Probable Maximum Precipitation in California.
W75-12165 2B

Wasting a River,
W75-12211 6G

Computer Controlled Wastewater Reclamation Plant,
W75-12361 5D

Water-Level Fluctuations and Earthquakes on the San Andreas Fault Zone,
W75-12392 4B

**CANADA**
Spray Irrigation of Treated Municipal sewage,
W75-11856 5D

Package Treatment Plants and Factors Affecting Service,
W75-11857 5D

European Dewatering System Aids Quebec Project,
W75-11918 5D

Geochemistry and Nutrient Regime of Saline Eutrophic Lakes in the Erickson-Elphinstone District of Southwestern Manitoba.
W75-11982 5C

Evaluating the Productivity of Pine Forests in the Hinton-Edson Area, Alberta, From Soil Survey Maps,
W75-12003 4A

Daily Fall Activity and Direction of Movements of Fish in Lake Quenouille in the Laurentians, (In French),
W75-12064 2H

Biochemical Characteristics of Digested Chemical Sewage Sludges,
W75-12132 5D

Emigration of the Peamouth Chub, Mylocheilus Caurinus, Across a Dilute Seawater Bridge: An Experimental Zoogeographic Study,
W75-12151 2L

Life History Notes and Meristic Variation in the Freshwater Fourspine Stickleback, Apeltes Quadracus (Mitchill), Near Sept-Iles: Quebec,
W75-12176 2I

Proceedings of the Annual Conference of the British Columbia Water and Waste Association.
W75-12350 5F

Canadian Drinking Water Surveillance Programs, Panel Discussion,
W75-12355 5G

Turbo-Drilling as Applied to Potash Developments in the Saskatchewan Field,
W75-12397 8B

**CANADIAN DRINKING WATER STANDARDS AND OBJECTIVES**
Canadian Drinking Water Surveillance Programs, Panel Discussion,
W75-12355 5G

Canadian Drinking Water Standards Review, Ontario's Programs, Panel Discussion,
W75-12356 5G

Canadian Drinking Water Standards Review, Alberta, Saskatchewan and Manitoba, Panel Discussion,
W75-12357 5G

Canadian Drinking Water Standards Review, British Columbia, Panel Discussion,
W75-12358 5G

Canadian Drinking Water Standards Review, Northwest Territories and Yukon Territory, Panel Discussion,
W75-12359 5G

**CAPILLARY ACTION**
A Simultaneous Calculation of the Capillary-Sorption Potentials, Moisture and Flow of Water in Soils Using a Computer and Equations of Soil Moisture Movement, (In Russian),
W75-12208 2G

**CARBOHYDRATES**
Studies on Metabolic Activity of Benthic Bacteria Isolated from Three Lakes,
W75-11988 5C

**CARBON**
The Uptake and Utilization of Organic Carbon by Algae: An Essay in Comparative Biochemistry,
W75-11980 5C

**CARBONATE ROCKS**
Geochemistry of Strontium in the Scioto River Drainage Basin, Ohio,
W75-12052 2K

**CARCINOGENS**
Treatment Plant to be Tested for Carcinogens,
W75-12130 5F

**CARP**
Life History, Ecology, and Management of the Carp, Cyprinus Carpio Linnaeus, in Elephant Butte Lake.
W75-11972 6B

**CASCADE MOUNTAINS**
The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part I: Natural Conditions,
W75-12096 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part II: Techniques for the Physical Evaluation of Seeding,
W75-12108 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part III: Case Studies of the Effects of Seeding,
W75-12109 3B

**CASE STUDIES**
The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part III: Case Studies of the Effects of Seeding,
W75-12109 3B

**CASINGS**
Graphic Solutions to Tubing Movement in Deep Wells,
W75-11875 8

Wanted: Fewer Bit, Casing Sizes, Reward Many Benefits for Industry,
W75-11885 8

**CATIONS**
Cation Distribution in Soils as Related to Sewage Sludge Disposal on Land,
W75-12139 5

**CEMENT**
How to Use Thixotropic Slurries to Solve Cementing Problems,
W75-11886 8

**CEMENTING**
Running and Cementing Deep Well Liners,
W75-11895 8

**CEMENTING MATERIAL**
Cementing Off, Plugging, and Redrilling,
W75-12394 8

**CERCARIAE**
Studies on Effects of Cercarial Concentration and Length of Exposure on Infection of Mice by St. Lucian Schistosoma Mansoni Cercariae in a Natural Running-Water Habitat,
W75-11903 5

**CHANNEL IMPROVEMENT**
Diked Disposal Area Site No 12, Cleveland Harbor, Cuyahoga County, Ohio.
W75-12255 5

**CHANNELS**
A Mini-Project for Avon Harbor, North Carolina,
W75-12045 8

Impact of Intracoastal Waterway Maintenance Dredging on a Mud Bottom Benthos Community,
W75-12189

HEMICAL ANALYSIS
Phenolic Compounds of Wheat Leaves Under Drought Stress,
W75-11905 2I

Inorganics, (Literature Review),
W75-12072 5A

IEMICAL FRAGMENTATION
Chemical Fragmentation,
W75-12389 8E

IEMICAL PROPERTIES
Biological and Chemical Mechanisms in Eutrophication of Freshwater Lakes,
W75-11992 5C

IEMICAL TRANSFORMATION
Pick-up and Metabolism of DDT, Dieldrin and Photodieldrin by a Fresh Water Alga (Ankistrodesmus Amalloides) and a Microcrustacean (Daphnia Pulex),
W75-12007 5C

IEMICAL WASTES
Organic Chemicals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Application to Pretreatment Standards.
W75-12268 5G

IENOPODIACEAE
Survey of the Matric Water of Various Plant Groups,
W75-11883 2I

LORINATED HYDROCARBON PESTICIDES
Pick-up and Metabolism of DDT, Dieldrin and Photodieldrin by a Fresh Water Alga (Ankistrodesmus Amalloides) and a Microcrustacean (Daphnia Pulex),
W75-12007 5C

LORINATION
Alternative Methods of Disinfection,
W75-11858 5D

Disinfection to Protect Recreational Areas and Potable Water Supplies,
W75-12351 5D

Toxicity of Aquatic Organisms Caused by Chlorination,
W75-12353 5D

LOROPHYLL
The Effect of Hydrogen in Concentrations in Simulated Rain on the Moss Tortula Ruralis (HEDW.)Sm,
W75-11987 5C

LOROPHYTA
Morphology and Ultrastructure of Some Chlorococcal Algae from the Collection pf Algal Strains in Leningrad University. II. Tetraedron Braunii (Nag, in Kutz.) Komarkova-Legnerova Strain (Gromov) 1967/231,
W75-11997 5C

Morphology and Ultrastructure of Some Chlorococcal Algae from the Collection of Algal Strains in Leningrad University. I. Pseudospongiococcum Protococcoides Gen. Nov., Sp. Nov.,
W75-12000 5C

Growth of the Green Alga Codium Fragile in a Connecticut Estuary,
W75-12051 5C

CHONDROCOCCUS-COLUMNARIS
Seasonal Prevalence of Chondrococcus Columnaris Infection in Black Bullheads from Clear Lake, Iowa,
W75-11995 5C

CHRYSOPHYTA
Endocytosis of Microcystis Aeruginosa by Ochromonas Danica,
W75-11985 5C

CHUB (PEAMOUTH)
Emigration of the Peamouth Chub, Mylocheilus Caurinus, Across a Dilute Seawater Bridge: An Experimental Zoogeographic Study,
W75-12151 2L

CHUKCHI SEA
Major Late-Winter Features of Ice in Northern Bering and Chukchi Seas as Determined From Satellite Imagery,
W75-12168 2C

CIRCADIAN RYTHMS (FISH)
Daily Fall Activity and Direction of Movements of Fish in Lake Quenouille in the Laurentians, (In French),
W75-12064 2H

CITIES
The Simple ATDL Urban Air Pollution Model,
W75-12038 5A

Train V. City of New York (Class Action by City to Compel EPA to Allot Funds Authorized by the 1972 Federal Water Pollution Control Act Amendments).
W75-12284 6E

Train V. Campaign Clean Water, Inc. (Action by Environmental Group to Require EPA to Release Funds Authorized for Federal Grants to Municipalities for Water Pollution Control.
W75-12285 6E

CITRULLUS-COLOCYNTHIS
Role of Epidermal Cell Turgor on Stomatal Regulation in Isolated Epidermal Peelings of Citrullus Colocynthis Linn. (Schrad.),
W75-12323 2I

CLAMS
Filtration of Neutral Red by Fresh Water Clams in Aerobic and Hypoxic Conditions,
W75-12192 5C

CLASS ACTION SUITS
The Florida Environmental Protection Act of 1971: The Citizen's Role in Environmental Management,
W75-12207 6G

CLASSIFICATION
Classification of Wisconsin Lakes by Trophic Condition.
W75-11979 5C

CLEANING
Running and Cementing Deep Well Liners,
W75-11895 8F

Hydraulic Sewer Pipeline Cleaner,
W75-11944 5D

Method of Cleaning and Stimulating a Water Well,
W75-12301 3B

CLEAR LAKE (IOWA)
Seasonal Prevalence of Chondrococcus Columnaris Infection in Black Bullheads from Clear Lake, Iowa,
W75-11995 5C

CLEVELAND HARBOR
Diked Disposal Area Site No 12, Cleveland Harbor, Cuyahoga County, Ohio.
W75-12255 5E

CLIMATIC ZONES
Meteoro-Hydrological Aspects of Rainfall in Japan.
W75-12030 2B

CLOGGING
A New Approach to Permeability Reduction,
W75-11872 8G

Thin Section and Permeability Studies Call for Smaller Gravels in Gravel Packing,
W75-11893 8B

CLOSTRIDIUM
Bacterial Processes for Improved Oil Recovery.
W75-12391 2F

CLOUD CHAMBERS
Testing of Cloud Seeding Materials at the Cloud Simulation and Aersol Laboratory, 1971-1973,
W75-12099 3B

CLOUD MODELS
A Detailed Microphysical Simulation of Hygroscopic Seeding on the Warm Rain Process,
W75-12090 3B

CLOUD PHYSICS
Formation of Graupel,
W75-12093 3B

CLOUD SEEDING
On the Variability of 'Dynamic Seedability' as a Function of Time and Location Over South Florida: Part I. Spatial Variability,
W75-12089 3B

A Detailed Microphysical Simulation of Hygroscopic Seeding on the Warm Rain Process,
W75-12090 3B

Florida Area Cumulus Experiments 1970-1973 Rainfall Results,
W75-12091 3B

A Numerical Model of Precipitation from Seeded and Unseeded Cold Orographic Clouds,
W75-12098 3B

Testing of Cloud Seeding Materials at the Cloud Simulation and Aersol Laboratory, 1971-1973,
W75-12099 3B

An Explanation for the Unusual Nucleating Ability of Aerosols Produced from the AgI-NH4I-Acetone System,
W75-12100 3B

Analysis of Radar Observations of a Randomized Cloud Seeding Experiment,
W75-12101 3B

The Effect of Persistence of AgI on Randomized Weather Modification Experiments,
W75-12104 3B

On the Design and Evaluation of Cumulus Modification Experiments,
W75-12105 3B

Evaluation by Monte Carlo Tests of Effects of Cloud Seeding on Growing Season Rainfall in North Dakota,
W75-12106 3B

**CLOUD SEEDING**

Bayesian and Classical Statistical Methods Applied to Randomized Weather Modification Experiments,
W75-12107 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part II: Techniques for the Physical Evaluation of Seeding,
W75-12108 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part III: Case Studies of the Effects of Seeding,
W75-12109 3B

**CLOUDS**
The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part I: Natural Conditions,
W75-12096 3B

**COAGULATION**
Study on Direct Rapid Filtration Using Reduced Coagulants, (In Japanese),
W75-11860 5D

Recyclable Coagulants Look Promising for Drinking Water Treatment,.
W75-11909 5F

Method for Processing Sludge,
W75-12312 5D

**COAL FILTRATION**
Evaluation of a Coal-Sewage Treatment Pilot Plant.
W75-12128 5D

**COAL MINE WASTES**
Water Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Wyoming, Montana, and North Dakota, 1975.
W75-11961 5A

**COAL MINES**
Coal Mine Drainage Pollution--1973,
W75-12114 5G

**COAL REGIONS (U.S.)**
Water Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Wyoming, Montana, and North Dakota, 1975.
W75-11961 5A

**COALS**
Evaluation of a Coal-Sewage Treatment Pilot Plant.
W75-12128 5D

**COAST GUARD REGULATIONS**
Enforcing International Law: U.S. Agencies and the Regulation of Oil Pollution in American Waters,
W75-12246 5G

**COASTAL CURRENTS**
Coastwise Currents in the Vicinity of Chicago, and Currents Elsewhere in Southern Lake Michigan,
W75-12161 2H

**COASTAL MARINE ENVIRONMENT**
Nitrogen, Phosphorus, and Eutrophication in the Coastal Marine Environment,
W75-12236 5C

**COASTAL MARSHES**
Property (Wetlands Regulation),
W75-12247 6E

**COASTAL STRUCTURES**
The Rush for Offshore Oil and Gas: Where Things Stand on the Outer Continental Shelf.
W75-12222 5G

**COASTAL WATERS**
International Law, U.S. Seabeds Policy and Ocean Resource Development,
W75-12214 6E

**COASTAL ZONE MANAGEMENT**
1974 Annual Report, Great Lakes Basin Commission.
W75-12238 5G

Marine Sanctuaries.
W75-12261 6E

Estuarine Sanctuary Grants--Application and Selection Criteria Procedures.
W75-12262 6E

**COASTAL ZONE MANAGEMENT ACT**
The Rush for Offshore Oil and Gas: Where Things Stand on the Outer Continental Shelf.
W75-12222 5G

**COASTS**
Coastwise Currents in the Vicinity of Chicago, and Currents Elsewhere in Southern Lake Michigan,
W75-12161 2H

Marine Sanctuaries.
W75-12261 6E

Estuarine Sanctuary Grants--Application and Selection Criteria Procedures.
W75-12262 6E

**COASTWISE CURRENTS**
Coastwise Currents in the Vicinity of Chicago, and Currents Elsewhere in Southern Lake Michigan,
W75-12161 2H

**COATINGS**
Corrosion.
W75-11888 8G

**CODIUM-FRAGILE**
Growth of the Green Alga Codium Fragile in a Connecticut Estuary,
W75-12051 5C

**COLIFORMS**
Comparative Survival of Enterococci, Coliforms and Salmonellas in Water, (In Russian),
W75-11973 5C

Influence of Environmental Stress on Enumeration of Indicator Bacteria from Natural Waters,
W75-12053 5C

Microbiology of a Former Dredge Spoil Disposal Area,
W75-12191 5C

**COLLOIDS**
A New Approach to Permeability Reduction,
W75-11872 8G

**COLOR**
The Assessment of Water Quality,
W75-12054 5F

**COLORADO**
Individual Home Wastewater Characterization and Treatment,
W75-11852 5D

The Effect of Persistence of AgI on Randomized Weather Modification Experiments,
W75-12104 3B

Colorado Public Interest Research Group, Inc. V. Train (Citizen Suit to Compel the Environmental Protection Agency to Control Discharge or Radioactive Materials into Navigable Waters).
W75-12287 6E

Flood Plain Information: Fountain Creek, Colorado Springs, Manitou Springs, Colorado.
W75-12372 2E

**COMBINED SEWERS**
Combined Wastewater Overflows,
W75-11912 5D

Steel, Concrete Form Sewer Support System.
W75-11921 5D

Superposition of Two Pipes in a Common, Mixed Sewer System (Recours a la superposition de deux conduites dans un reseau d'assainissement unitaire).
W75-11923 5D

Up-Flow Separator,
W75-11936 5D

**COMMERCIAL FISHING**
Fisheries Economics. A Bibliography,
W75-12181 3E

Information Report on the Law of the Sea: Understanding the Debate of the Law of the Ocean Space.
W75-12252 6E

**COMMERCIAL SHELLFISH**
Municipal Sewage Treatment to Protect Shellfish Growing Waters,
W75-12352 5D

**COMMON ENEMY RULE**
Borgmann V. Florissant Development Co (Action to Enjoin Adjoining Property Owners From Collecting and Discharging Surface Water onto Plaintiffs' Land).
W75-12289 6E

**COMMON LAW**
The Federal Common Law of Accretion: A New Element in Property Law,
W75-12205 6E

**COMPACTION**
A Laboratory Study of the Effects of Confining Pressure on Fracture Flow and Storage Capacity in Carbonate Rocks,
W75-11892 4A

**COMPETING USES**
Uses of Scientific Information in Environmental Decision-Making,
W75-12204 6G

**COMPOSITING**
Composting and use of Compost in Sweden,
W75-12339 5E

**COMPREHENSIVE PLANNING**
1974 Annual Report, Great Lakes Basin Commission.
W75-12238 5G

Those Elusive 1985 Water Quality Goals.
W75-12242 5G

**COMPUTER MODELS**
Effect of Hysteresis on the Prediction of Infiltration, Redistribution and Drainage of Water in a Layered Soil,
W75-12041 2G

**COMPUTER PROGRAMS**
A Computer Program Used to Estimate Primary Productivity from pH and Carbon Dioxide Data Employing the Upstream-Downstream Method,
W75-11971 5C

**COMPUTERS**
New Computer System Monitors Baton Rouge Sewers.
W75-11927 7C

Computer's Master Plan Signals Sewer Problems Before They Start,
W75-11928 7C

Control System for Showa Water Purification Plant, (In Japanese),
W75-12147 5F

Recent Developments of Instrumentation, Control and Automation Systems for Wastewater Treatment Systems,
W75-12341 5D

**CONCRETE MIXES**
How to Use Thixotropic Slurries to Solve Cementing Problems,
W75-11886 8F

**CONCRETE STRUCTURES**
Introduction of Bills to Authorize the Replacement of the American Falls Dam in Idaho.
W75-12278 6E

**CONDEMNATION**
United States v. 187.40 Acres of Land, Huntingdon County, Pa. (Action to Condemn Land for Use in Constructing Flood Control Project).
W75-12299 6E

**CONDENSATION**
Process and Apparatus for Recovering Clean Water and Solids from Dilute, Aqueous, Solids Containing Solutions or Dispersions,
W75-12059 5D

**CONDUITS**
Screen Retainer Assembly,
W75-11942 8C

**CONFERENCES**
Systems Approach to Hydrology.
W75-12014 2A

Are We Any Nearer to an International Agreement on Use of the Seas,
W75-12224 6E

Basic Principles Relating to the International Regime of the Oceans at the Caracas Session of the U. N. Law of the Sea Conference,
W75-12253 6E

**CONGRESSIONAL HEARINGS**
Ocean Dumping Oversight.
W75-12194 5G

Solar Sea Thermal Energy.
W75-12196 3E

Diversion and Withdrawal of Additional Water from Lake Michigan into the Illinois Waterway.
W75-12197 4A

Federal Ocean Programs Review.
W75-12200 6E

High Seas Oil Port Act.
W75-12201 5G

**CONNECTICUT**
Growth of the Green Alga Codium Fragile in a Connecticut Estuary,
W75-12051 5C

**CONNECTICUT RIVER**
Hydrogeologic Data for the Lower Connecticut River Basin, Connecticut,
W75-19954 7C

**CONSTITUTIONAL LAW**
Validity, Under Federal Constitution, of State Statute or Local Ordinance Regulating Phosphate Content of Detergents,
W75-12293 6E

**CONSTRUCTION COSTS**
Sewer System Evaluation and Rehabilitation Cost Estimates,
W75-11951 6C

New Orleans Chooses Oxygen Activated Sludge.
W75-12318 5D

**CONSTRUCTION MATERIALS**
Application of PVC Bell-and-Spigot Pressure Pipes in Construction of Water Supply Lines (Die Anwendung von PVC-Muffendruckrohren beim Bau von Wasserversorgungsnetzen),
W75-11949 8A

**CONSUMPTIVE USE**
Planning Models for Water System Development in Mississippi Communities,
W75-11851 6D

Water Consumption Trends Within the Central and Southern Florida Flood Control District,
W75-12085 6D

**CONTINENTAL SHELF**

Process for Demineralizing Water,
W75-12311 3A

DENITRIFICATION
Nitrogen Removal from Municipal Wastewater,
W75-11859 5D

DEPENDABLE SUPPLY
Water Supply.
W75-12297 6E

DESIGN
Graphical Method Speeds Deviated Well Casing Design,
W75-11896 8G

DESIGN CRITERIA
Graphic Solution to Fracture Treatment Design,
W75-11876 8B

Bit Design is Key to Deep Drilling with Turbines,
W75-11889 8C

Design and Operating Criteria for Rural Water Systems,
W75-12126 6D

DESULFOVIBRIA HYDROCARBONOCLASTICUS
Bacterial Processes for Improved Oil Recovery.
W75-12391 2F

DETERGENTS
Detergent Phosphorus and Algal Growth,
W75-12001 5C

Soap and Detergent Manufacturing Point Source Category--Effluent Limitations Guidelines.
W75-12269 5G

Studies of Prevention of Water Pollution, III. On the Biodegradation of Synthetic Detergents, (In Japanese),
W75-12316 5B

DETERIORATION
The Floating Cover: Best Way to Cover a Finished-Water Reservoir,
W75-12360 5F

DEUTERIUM
Use of Environmental Isotope Methods as a Reconnaissance Tool in Groundwater Exploration Near San Antonio de Pichincha, Ecuador,
W75-12080 2F

DEWATERING
European Dewatering System Aids Quebec Project,
W75-11918 5D

Minneapolis Keeps on Truckin',
W75-12319 5D

Control of Groundwater at Bancroft Mines, Zambia,
W75-12395 4B

DIAGENESIS
Studies in the System CaCO:-FeCO3: 1. Phase Relations; 2. A Method for Major-Element Spectrochemical Analysis; 3. Compositions of Some Ferroan Dolomites,
W75-12400 2F

DIAMOND BIT DESIGN
Bit Design is Key to Deep Drilling with Turbines,
W75-11889 8C

DIFFUSION
Diffusion Estimation for Small Emissions,
W75-12039 5A

Dispersion and Settling Around a Waste Disposal Point in a Shallow Sea,
W75-12043 5B

DIFFUSIVITY
On Solving the Flow Equation in Unsaturated Soils by Optimization: Horizontal Infiltration,
W75-12083 2G

DIGESTER GAS
Digester Gas: Valuable Plant Fuel,
W75-12332 8C

DIGITAL COMPUTERS
Computer Controlled Wastewater Reclamation Plant,
W75-12361 5D

DIRECT FILTRATION
Operational Variables and Limitations of Direct Filtration,
W75-12127 5F

DIRECT SAND FILTRATION
Study on Direct Rapid Filtration Using Reduced Coagulants, (In Japanese),
W75-11860 5D

DISINFECTION
Alternative Methods of Disinfection,
W75-11858 5D

Disinfection to Protect Recreational Areas and Potable Water Supplies,
W75-12351 5D

ISPERSION
Environmental Research Laboratories, 1973 Annual Report.
W75-12033 5A

Application of a Simple Dispersion Model to a Rural Industrial Region,
W75-12037 5A

Diffusion Estimation for Small Emissions,
W75-12039 5A

Vertical Temperature Profiles in Open-Channel Flow,
W75-12047 5B

SSOLVED AIR FLOTATION
Primary Solids/Liquid Separation.
W75-12153 5D

SSOLVED OXYGEN
Aeration Upgrades Reservoir,
W75-12346 5F

STRIBUTION
Distribution of Aquatic Macrophytes Related to Paper Mill Effluents in a Southern Michigan Stream,
W75-11991 2B

Distribution and Biomass of Macrophytes in Lake Dgal Maly,
W75-11993 8I

STRIBUTION SYSTEMS
Clearwell Quality Doesn't Last,
W75-12340 5F

URNAL
Diurnal Fluctuations of Water Tables Induced by Atmospheric Pressure Changes,
W75-12077 2G

OLOMITE
Studies in the System CaCO:-FeCO3: 1. Phase Relations; 2. A Method for Major-Element Spectrochemical Analysis; 3. Compositions of Some Ferroan Dolomites,
W75-12400 2F

OMESTIC WASTES
Individual Home Wastewater Characterization and Treatment,
W75-11852 5D

Package Treatment Plants and Factors Affecting Service,
W75-11857 5D

AINAGE
Water Bank Program.
W75-12259 6E

AINAGE AREA
Draining Telford New Town.
W75-11917 4A

EDGE SPOIL DISPOSAL SITE
Microbiology of a Former Dredge Spoil Disposal Area,
W75-12191 5C

EDGING
Impact of Intracoastal Waterway Maintenance Dredging on a Mud Bottom Benthos Community,
W75-12189 5C

Microbiology of a Former Dredge Spoil Disposal Area,
W75-12191 5C

Diked Disposal Area Site No 12, Cleveland Harbor, Cuyahoga County, Ohio.
W75-12255 5E

DRILL BITS
Wanted: Fewer Bit, Casing Sizes, Reward: Many Benefits for Industry,
W75-11885 8C

DRILL CUTTINGS
How Downhole Temperatures, Pressures Affect Drilling, Part 9, Navel Ways to Detect Abnormal Pressure,
W75-11868 8C

DRILL HOLES
Drillability Studies: Percussive Drilling in the Field,
W75-12384 8E

DRILLABILITY
Fragmentation.

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part I: Natural Conditions,
W75-12096 3B

OAPS
Soap and Detergent Manufacturing Point Source Category-Effluent Limitations Guidelines.
W75-12269 5G

ODIUM COMPOUNDS
Sodium Hydroxide Treatment of Acid Mine Drainage,
W75-12116 5G

ODIUM HYDROXIDE
Sodium Hydroxide Treatment of Acid Mine Drainage,
W75-12116 5G

OIL ALGAE
Morphology and Ultrastructure of Some Chlorococcal Algae from the Collection of Algal Strains in Leningrad University. I. Pseudospongiococcum Protococcoides Gen. Nov., Sp. Nov.,
W75-12000 5C

OIL COLUMNS
Effect of Hysteresis on the Prediction of Infiltration, Redistribution and Drainage of Water in a Layered Soil,
W75-12041 2G

OIL EROSION
A Mobile Sprinkler Irrigation Facility for Measurement of Surface Runoff and Soil Erosion (Eine Transportable Beregnungsanlage fuer die Messung von Oberflaechenabfluss und Bodenabtrag),
W75-11948 7B

Introduction of Shore Erosion Control Legislation.
W75-12279 6E

OIL FUNGI
Fungus Diseases of Wheat on Irrigated Lands. (In Russian),
W75-11904 2I

OIL HORIZONS
Transformation System in Flood Runoff Phenomena,
W75-12016 2E

OIL MOISTURE
A Thermodynamic Integral Equation for the Equilibrium Moisture Profile in Swelling Soil,
W75-12050 2G

A Simultaneous Calculation of the Capillary-Sorption Potentials, Moisture and Flow of Water in Soils Using a Computer and Equations of Soil Moisture Movement, (In Russian),
W75-12208 2G

Rapid Soil Moisture Determination by Immersion Method, (In Korean),
W75-12240 2G

OIL MOISTURE METERS
Soil Water Measurement with an Inexpensive Spectrophotometer,
W75-12081 2G

OIL PROFILES
Cation Distribution in Soils as Related to Sewage Sludge Disposal on Land,
W75-12139 5B

OIL SCIENCE
Cation Distribution in Soils as Related to Sewage Sludge Disposal on Land,
W75-12139 5B

SOIL SURVEYS
Evaluating the Productivity of Pine Forests in the Hinton-Edson Area, Alberta, From Soil Survey Maps,
W75-12003 4A

SOIL TYPES
The Utilization of Phosphorus from Muds by the Phytoplankter, Scenedesmus Dimorphus, and the Significance of These Findings to the Practice of Pond Fertilization,
W75-11986 5C

SOIL WATER
Effect of Hysteresis on the Prediction of Infiltration, Redistribution and Drainage of Water in a Layered Soil,
W75-12041 2G

Influence of Soil Water Matric Potential and Resistance to Penetration on Corn Root Elongation,
W75-12055 3F

Soil Water Measurement with an Inexpensive Spectrophotometer,
W75-12081 2G

Diurnal and Seasonal Soil Water Uptake and Flux Within a Bermudagrass Root Zone,
W75-12082 2D

SOIL WATER CHARACTERISTIC
A One-Step Wetting Procedure for Determining Both Water Characteristic and Hydraulic Conductivity of a Soil Core,
W75-12084 2G

SOIL WATER CONTENT
Soil Water Measurement with an Inexpensive Spectrophotometer,
W75-12081 2G

SOIL WATER MOVEMENT
A One-Step Wetting Procedure for Determining Both Water Characteristic and Hydraulic Conductivity of a Soil Core,
W75-12084 2G

SOILS
Chemical Tests for Plant Available Metals in Soils.
W75-12142 5A

Statistical Investigation of the Relation Between Absorbability and Content of Grain-size Fractions and Humus, (In Russian),
W75-12344 2G

SOLAR RADIATION
Distribution of Solar Radiation Within a Deciduous Forest,
W75-12034 2I

SOLAR SEA POWERPLANTS
Solar Sea Thermal Energy.
W75-12196 3E

SOLID WASTES
1973 IMCO Conference on Marine Pollution From Ships.
W75-12202 5G

Tough Solid-Waste Laws Brewing on Capitol Hill.
W75-12243 5G

SOLIDS REMOVAL
Primary Solids/Liquid Separation.
W75-12153 5D

SOLUTION MINING TECHNIQUES
Specialized Underground Extraction Systems.
W75-12388 8B

SORPTION
A Simultaneous Calculation of the Capillary-Sorption Potentials, Moisture and Flow of Water in Soils Using a Computer and Equations of Soil Moisture Movement, (In Russian),
W75-12208 2G

SOUNDING
On the Variability of 'Dynamic Seedability' as a Function of Time and Location Over South Florida: Part I. Spatial Variability,
W75-12089 3B

SOUTH CAROLINA
Storm Tide Frequencies on the South Carolina Coast,
W75-12160 2L

SOUTH SANTIAM RIVER (ORE)
Flood Plain Information: South Santiam River, Lebanon, Oregon.
W75-12376 4A

SOUTHEAST U.S.
Water Resources Programs in the Southeastern Region.
W75-11960 9D

Surface Water Supply of the United States, 1966-70: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins - Volume 3. Basins from Apalachicola River to Pearl River.
W75-11967 7C

SPATIAL DISTRIBUTION
Experimentally Increased Fish Stock in the Pond Type Lake Warniak. XIII. Distribution and Biomass of the Lemnaceae and the Fauna Associated with Them,
W75-12009 8I

SPECIFIC CAPACITY
Innovative Workover for Wasson Water Wells,
W75-11890 3B

SPECIFIC DRILLING IMPEDANCE
Drilling Impedance of Mud Solids,
W75-11897 8C

SPECTROMETERS
Soil Water Measurement with an Inexpensive Spectrophotometer,
W75-12081 2G

SPECTROPHMETRY
Observations on the Atomic Absorption Behavior of Some of the Earth Elements,
W75-11862 5A

SPECTROPHOTOMETRY
Toxicity of Copper Complexes to RFreshwater Mollusks,
W75-11863 5C

SPILLOVER EFFECTS
International Economics and Environment Control,
W75-12178 6G

SPILLWAYS
Corps' Guidelines for Dam Safety Inspection Need Revamping,
W75-12241 8A

SPRAY IRRIGATION
Spray Irrigation of Treated Municipal sewage,
W75-11856 5D

SPRAYS
Irrigation System,
W75-12309 3F

SPREADING BASINS
Artificial Groundwater Recharge, I. Circular Recharging Area,
W75-12040 4B

SPRINKLER IRRIGATION
Irrigation Apparatus,
W75-12302 3F

ST. PETERSBURG (FLA)
Recycling Allows Zero Wastewater Discharge,
W75-12364 5D

STACK EFFLUENTS
Diffusion Estimation for Small Emissions,
W75-12039 5A

STANDARDS
The Effect of Legislation of the Future Use of Water in the Leather Industry,
W75-12112 5D

Timber Products Processing Point Source Category--Effluent Guidelines and Standards.
W75-12267 5G

Nonferrous Metals Manufacturing Point Source Category--Effluent Guidelines and Standards and Proposed Limitations.
W75-12276 5G

STANDING (LEGAL)
The Florida Environmental Protection Act of 1971: The Citizen's Role in Environmental Management,
W75-12207 6G

STANFORD WATERSHED MODEL
Numerical Simulation of Watershed Hydrology,
W75-12027 2A

STATE GOVERNMENTS
The Water Pollution Permitting System,
W75-12245 5G

Beet Sugar Processing Point Source Subcategory--Effluent Guidelines and Standards.
W75-12271 5G

STATE JURISDICTION
Property (Wetlands Regulation),
W75-12247 6E

Admiralty's Power in RE Oil Pollution (States Able to Set More Stringent Penalties),
W75-12248 5G

STATE POLICY
A Proposal for the Quantification of Reserved Indian Water Rights,
W75-12249 6E

STATISTICAL METHODS
A Study of Long Range Runoff System Response Based on Information Theory,
W75-12018 2A

STATISTICAL MODELS
Systems Approach to Hydrology.
W75-12014 2A

STATISTICAL STUDIES
Statistical Investigation of the Relation Between Absorbability and Content of Grain-size Fractions and Humus, (In Russian),
W75-12344 2G

STATISTICS
Bayesian and Classical Statistical Methods Applied to Randomized Weather Modification Experiments,
W75-12107 3B

STD OBSERVATIONS
STD, Current Meter, and Drogue Observations in Rosario Strait, January - March 1974,
W75-12175 2L

STEAM
The Potential for Energy Production from Geothermal Resources.
W75-12199 4B

STEEL
Iron and Steel Manufacturing Point Source Category--Effluent Guidelines and Standards.
W75-12264 5G

STICKLEBACKES
Life History Notes and Meristic Variation in the Freshwater Fourspine Stickleback, Apeltes Quadracus (Mitchill), Near Sept-Iles: Quebec,
W75-12176 2I

STOCHASTIC PROCESSES
Stochastic Hydrologic Systems,
W75-12015 2A

A Study of Long Range Runoff System Response Based on Information Theory,
W75-12018 2A

Nonlinear Runoff Kernels of Hydrologic System,
W75-12019 2A

Kernels of Stochastic Linear Hydrologic Systems,
W75-12021 2A

The Stochastic Kinematic Wave,
W75-12023 2A

Simulation of the Short-Time Scour-Fill Process in Erodible Streams with Stochastic Sediment Transfer at the Stream Bed,
W75-12029 2J

STOMATA
Role of Epidermal Cell Turgor on Stomatal Regulation in Isolated Epidermal Peelings of Citrullus Colocynthis Linn. (Schrad.),
W75-12323 2I

STORAGE TANKS
The Floating Cover: Best Way to Cover a Finished-Water Reservoir,
W75-12360 5F

STORM DRAINS
Tough Digging, Tight Quarters Hamper Hull Collector Sewer Job,
W75-11919 5D

Sanitary Sewer Suspended within Storm Sewer,
W75-11920 5D

Steel, Concrete Form Sewer Support System.
W75-11921 5D

STORM OVERFLOW
The Graphical Hydrographs Method With the Intermediary of Storm Overflows and Flood Retention Tanks (Das grafische Abfluss-ganglinienverfahren mit Zwischenschaltung von RUE und RB),
W75-11861 5D

STORM RUNOFF
Experiments with Unconventional Storm Overflows,
W75-11940 5D

STORM SEWAGE TANKS
The Use of Storm Tanks for Tertiary Treatment of Sewage,
W75-11941 5D

STORM SURGE
Storm Tide Frequencies on the South Carolina Coast,
W75-12160 2L

Estimation of Hurricane Storm Surge in Apalachicola Bay, Florida,
W75-12164 2B

STORM TIDES
Storm Tide Frequencies on the South Carolina Coast,
W75-12160 2L

STORMS
Estimation of Hurricane Storm Surge in Apalachicola Bay, Florida,
W75-12164 2B

STREAM EROSION
Simulation of the Short-Time Scour-Fill Process in Erodible Streams with Stochastic Sediment Transfer at the Stream Bed,
W75-12029 2J

STREAM FLOW
The Use of a Multizone Hydrologic Model With Distributed Rainfall and Distributed Parameters in the National Weather Service River Forecast System,
W75-12159 2B

STREAMFLOW
Flood Profiles in the Umpqua River Basin, Oregon: Part 3, Umpqua River Below Scottburg, Scholfield, Cow Creek Above Glendale,
W75-11959 4A

Surface Water Supply of the United States, 1966-70: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins - Volume 3. Basins from Apalachicola River to Pearl River.
W75-11967 7C

Surface Water Supply of the United States, 1966-70: Part 6. Missouri River Basin--Volume 1. Missouri River Basin above Williston, North Dakota.
W75-11968 7C

Surface Water Supply of the United States, 1966-70: Part 7. Lower Mississippi River--Volume 2. Arkansas River Basin.
W75-11969 7C

A Bayesian Framework for the Use of Regional Information in Hydrology,
W75-12048 6A

1974 Water Resources Data for Oregon, Surface Water Records, Precipitation Records,
W75-12087 7C

STREAMS
A Computer Program Used to Estimate Primary Productivity from pH and Carbon Dioxide Data Employing the Upstream-Downstream Method,
W75-11971 5C

Distribution of Aquatic Macrophytes Related to Paper Mill Effluents in a Southern Michigan Stream,
W75-11991 2B

TREPTOCOCCUS
Comparative Survival of Enterococci, Coliforms and Salmonellas in Water, (In Russian),
W75-11973 5C

TRESS
Influence of Environmental Stress on Enumeration of Indicator Bacteria from Natural Waters,
W75-12053 5C

TRICT LIABILITY
Admiralty's Power in RE Oil Pollution (States Able to Set More Stringent Penalties),
W75-12248 5G

TRONTIUM
Geochemistry of Strontium in the Scioto River Drainage Basin, Ohio,
W75-12052 2K

TRUCTURES
Permits for Activities in Navigable Waters or Ocean Waters.
W75-12263 6E

UBMERGED LANDS
Submerged Lands (State Title to Certain Submerged Lands).
W75-12288 6E

UBSURFACE WATERS
Fresh Water Strata of Mississippi as Revealed by Electrical Log Studies,
W75-12399 4B

UCCESSION
A Quantitative Measure of Succession Rate and Its Application to the Phytoplankton of Lakes,
W75-12005 5C

UCCESSION RATE
A Quantitative Measure of Succession Rate and Its Application to the Phytoplankton of Lakes,
W75-12005 5C

UGAR BEETS
Beet Sugar Processing Point Source Subcategory--Effluent Guidelines and Standards.
W75-12271 5G

ULFATES
Application of the Methylthymol Blue Sulfate Method to Water and Wastewater Analysis,
W75-12324 5A

ULFURIC ACID
Acid Mine Drainage in Cane Creek Basin, Near Oakman, Walker County, Alabama,
W75-11871 5G

URF
Tarshis v. Lahaina Investment Corp. Responsibility of Owner of Beach Front Property to Warn of Surging Wave).
W75-12296 6E

URFACE IRRIGATION
Trickle Irrigation System,
W75-12184 3F

URFACE WATER
Water-Treatment Sludge Filtration Studies,
W75-12069 5D

Pollution Effects on Surface Waters and Groundwaters,- (Literature Review),
W75-12070 5B

SURFACE WATERS
Water Resources Data for California, 1973: Part 2. Water Quality Records.
W75-11962 7C

Quality of Surface Waters of the United States, 1970: Part 6. Missouri River Basin.
W75-11964 7C

Quality of Surface Waters of the United States, 1970: Part 8. Western Gulf of Mexico Basins.
W75-11965 7C

Quality of Surface Waters of the United States, 1969: Part 8. Western Gulf of Mexico Basin.
W75-11966 7C

Surface Water Supply of the United States, 1966-70: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins - Volume 3. Basins from Apalachicola River to Pearl River.
W75-11967 7C

Water-Quality Data, 1948-73, Anchorage and Vicinity, Alaska,
W75-19955 5A

SURGE TANKS
Refrigerated Surge Tank for Use With Aerobic Sewage Digestion System,
W75-11930 5D

SURVEYS
Oregon Surveys its Hazardous Wastes,
W75-12239 5G

SUSPENDED SOLIDS
Study on Direct Rapid Filtration Using Reduced Coagulants, (In Japanese),
W75-11860 5D

Operational Variables and Limitations of Direct Filtration,
W75-12127 5F

SUSPENSION
Study on Direct Rapid Filtration Using Reduced Coagulants, (In Japanese),
W75-11860 5D

SWAMPS
Big Cypress National Preserve (Part 1).
W75-12195 6G

SWEDEN
Water Conservation in Sweden: II. Pollution Control,
W75-12317 5G

Composting and use of Compost in Sweden,
W75-12339 5E

SWELLING SOIL
A Thermodynamic Integral Equation for the Equilibrium Moisture Profile in Swelling Soil,
W75-12050 2G

SYLVANIA RECREATION AREA (MICH)
Limnology of Lakes of the Sylvania Recreation Area, Ottawa National Forest,
W75-11981 2H

SYNTHETIC HYDROLOGY
Numerical Simulation of Watershed Hydrology,
W75-12027 2A

A Three-Component, Nonlinear Water-Yield Model,
W75-12031 2A

SYSTEMATICS
Morphology and Ultrastructure of Some Chlorococcal Algae from the Collection pf Algal Strains in Leningrad University. II. Monoraphidium Braunii (Nag, in Kutz.) Komarkova-Legnerova Strain (Gromov) 1967/231,
W75-11997 5C

Morphology and Ultrastructure of Some Chlorococcal Algae from the Collection of Algal Strains in Leningrad University. I. Pseudospongiococcum Protococcoides Gen. Nov., Sp. Nov.,
W75-12000 5C

SYSTEMS ANALYSIS
Systems Approach to Hydrology.
W75-12014 2A

The Structure of Inputs and Outputs of Hydrologic Systems,
W75-12017 2A

Effect of an Error in Discharge Measurements on the Detection Process in Runoff Systems Analysis,
W75-12020 2A

Efficiency of Parameter and State Estimation Methods in Relation to Models of Lumped and Distributed Hydrologic Systems,
W75-12025 2A

TACONITE TAILINGS
Response of Lake Superior Algae to Nutrients and Taconite Tailings,
W75-11976 5C

TANNERY WASTES
The Effect of Legislation of the Future Use of Water in the Leather Industry,
W75-12112 5D

Effluent Treatment for a Small Tannery,
W75-12118 5D

Some Aspects of a Chemical Treatment of the Waste Waters from the Beamhouse,
W75-12120 5D

No-Effluent Tannery Processes,
W75-12124 5D

TANNING WASTES
Some Aspects of Tannery Effluent Control,
W75-12123 5D

TAXES
Aquatic Weed Control - State Revenue Laws.
W75-12295 6E

TEMPERATURE
How Downhole Temperatures, Pressures Affect Drilling, Part 2, Detecting and Evaluating Formation Pressures,
W75-11866 8C

How Downhole Temperatures, Pressures Affect Drilling, Part 3, Overpressure Detection from Wireline Methods,
W75-11867 8C

How Downhole Temperatures, Pressures Affect Drilling, Part 10, Miscellaneous Ways to Detect Abnormal Pressure,
W75-11869 8C

The Water Relations of Hemlock (Tsuga Canadensis): III. The Temperature Dependence of Water Exchange in a Pressure Bomb,
W75-11902 2I

TEMPERATURE CONTROL
Irrigation System,
W75-12309 3F

TENNEESSEE
Application of a Simple Dispersion Model to a Rural Industrial Region,
W75-12037 5A

TERRITORIAL SEAS
International Law, U.S. Seabeds Policy and Ocean Resource Development,
W75-12214 6E

TERTIARY TREATMENT
The Use of Storm Tanks for Tertiary Treatment of Sewage,
W75-11941 5D

Fairfax Goes for AWT.
W75-11950 5D

TESTING
Testing of Cloud Seeding Materials at the Cloud Simulation and Aersol Laboratory, 1971-1973,
W75-12099 3B

TESTING PROCEDURES
The Use of a Specialized Drilling and Ground Water Sampling Technique for Delineation of Hexavalent Chromium Contamination in an Unconfined Aquifer, Southern New Jersey Coastal Plain,
W75-11899 5A

TEXAS
Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

Innovative Workover for Wasson Water Wells,
W75-11890 3B

Tracers Aid Placement of Stimulation Fluids,
W75-11898 8G

Flood Plain Information: Spring and Willow Creeks, Houston Metropolitan Area, Texas.
W75-12371 4

Flood Plain Information: Onion Creek, Austin, Texas.
W75-12374 4A

Flood Plain Information: Hackberry Creek and Cottonwood Branch, Dallas County, Texas.
W75-12379 4A

TEXTILE INDUSTRY
Strong Impact of Textiles by U.S. Water Control Act,
W75-12117 5G

TEXTILES
Strong Impact of Textiles by U.S. Water Control Act,
W75-12117 5G

THEORETICAL ANALYSIS
Effect of an Error in Discharge Measurements on the Detection Process in Runoff Systems Analysis,
W75-12020 2A

THERMAL POLLUTION
An Ecological Evaluation of Heated Water Discharge on Phytoplankton Blooms in the Potomac River,
W75-12004 5C

THERMAL POWER
Solar Sea Thermal Energy.
W75-12196 3E

THERMAL STRATIFICATION
Vertical Temperature Profiles in Open-Channel Flow,
W75-12047 5B

THERMOCLINE
Transfer of Heat, Fresh Water and Nutrients Through the Seasonal Thermocline,
W75-11994 5C

THERMODYNAMICS
Thermodynamic and Kinetic Aspects of Argillaceous Sandstone Acidizing,
W75-11891 4B

A Thermodynamic Integral Equation for the Equilibrium Moisture Profile in Swelling Soil,
W75-12050 2G

THIXOTROPIC CEMENT
How to Use Thixotropic Slurries to Solve Cementing Problems,
W75-11886 8F

THROUGHFALL
Relative Throughfall Enrichment by Biologic and by Aerosol-Derived Materials in Loblolly Pines,
W75-11853 5B

TIBBETTS CREEK (WASH)
Special Flood Hazard Information: Issaquah and Tibbetts Creeks, Issaquah and Vicinity, Washington.
W75-12377 4A

TIDAL EFFECTS
Dispersion and Settling Around a Waste Disposal Point in a Shallow Sea,
W75-12043 5B

TIDAL STREAMS
Cook Inlet Tidal Stream Atlas,
W75-12163 2L

TIDAL WATERS
Cook Inlet Tidal Stream Atlas,
W75-12163 2L

TIDES
Storm Tide Frequencies on the South Carolina Coast,
W75-12160 2L

Cook Inlet Tidal Stream Atlas,
W75-12163 2L

TILE DRAINS
Flow Quantities in Residential Weeping Tile Systems--A Calculational Method,
W75-12328 4A

TIME SERIES ANALYSIS
Stochastic Hydrologic Systems,
W75-12015 2A

TOKYO (JAPAN)
Mathematical Models and Simulation of Wastewater Treatment Systems,
W75-12156 5D

TONAWANDA CREEK (NEW YORK)
Flood Plain Information: Tonawanda Creek and Its Affected Tributaries, Erie and Niagara Counties, New York.
W75-12373 2E

TOPOGRAPHIC MAPPING
Oceanographic Observations in the Georgia Bight: Data Report for R V EASTWARD Cruises E-13-73 (4-11 September) and E-19-73 (8-9 December 1973),
W75-12169 2L

TORT LIABILITY
Tarshis v. Lahaina Investment Corp. (Responsibility of Owner of Beach Front Property to Warn of Surging Wave).
W75-12296 6E

TORTULA-RURALIS
The Effect of Hydrogen in Concentrations in Simulated Rain on the Moss Tortula Ruralis (HEDW.)Sm,
W75-11987 5C

TOXICITY
Toxicity of Copper Complexes to RFreshwater Mollusks,
W75-11863 5C

Effects of Oilfield Brine on Marine Organisms, an Ecological Evaluation of the Aransas Bay Area, Job No. 1,
W75-11864 5C

Pollution Effects on Surface Waters and Groundwaters,- (Literature Review),
W75-12070 5B

Are Chemicals Used Algae Control Biodegradable.
W75-12325 5C

Toxicity of Aquatic Organisms Caused by Chlorination,
W75-12353 5D

TOXINS
Effect of Bromex-50 on Plankton Population in Fish Ponds,
W75-12188 5C

TRACE ELEMENTS
Observations on the Atomic Absorption Behavior of Some of the Earth Elements,
W75-11862 5A

TRACERS
Tracers Aid Placement of Stimulation Fluids,
W75-11898 8G

TRACKING TECHNIQUES
The Use of a Specialized Drilling and Ground Water Sampling Technique for Delineation of Hexavalent Chromium Contamination in an Unconfined Aquifer, Southern New Jersey Coastal Plain,
W75-11899 5A

TRAINING
Saving Our Water Resources,
W75-12232 6G

Crew Training,
W75-12385 8G

TREATIES
1973 IMCO Conference on Marine Pollution From Ships.
W75-12202 5G

Are We Any Nearer to an International Agreement on Use of the Seas,

Water Resources Programs in the Southeastern Region.
W75-11960 9D

Understanding the Ocean Science Debate,
W75-12223 6E

**WATER RESOURCES DEVELOPMENT**

Water Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Wyoming, Montana, and North Dakota, 1975.
W75-11961 5A

Recognition of Substantive Rights Under NEPA,
W75-12250 6E

WATER REUSE
Individual Home Wastewater Characterization and Treatment,
W75-11852 5D

Spray Irrigation of Treated Municipal sewage,
W75-11856 5D

Complete Industrial Waste-Water Reuse Goal of Refining Study,
W75-12125 5D

Light and Assimilation Number in a Small Desert, Recharged-Groundwater Pond,
W75-12326 5A

Organic Residue in a Recycled Effluent, Part I,
W75-12348 5D

Computer Controlled Wastewater Reclamation Plant,
W75-12361 5D

Recycling Allows Zero Wastewater Discharge,
W75-12364 5D

WATER RIGHTS
A Proposal for the Quantification of Reserved Indian Water Rights,
W75-12249 6E

United States V. Cappaert (Action for Declaration of Rights of United States to Underground Waters Appurtenant to Devil's Hole, Death Vally National Monument).
W75-12281 6E

WATER SOFTENING
Water Treatment Device,
W75-12305 5F

Salt Recovery System,
W75-12306 5B

Recirculating Resin Cleaning Chemical Feeder System for Water Softeners,
W75-12307 3D

WATER SOURCES
Southern Nevada Water Project.
W75-11913 3B

General Aspects of Water Supply and Treatment in Ontario,
W75-12067 5F

Use of Environmental Isotope Methods as a Reconnaissance Tool in Groundwater Exploration Near San Antonio de Pichincha, Ecuador,
W75-12080 2F

North West: A Dirty Inheritance.
W75-12336 5G

WATER SPREADING
Artificial Groundwater Recharge, I. Circular Recharging Area,
W75-12040 4B

WATER STORAGE
Flood Plain Information: South Santiam River, Lebanon, Oregon.
W75-12376 4A

WATER SUPPLY
Innovative Workover for Wasson Water Wells,
W75-11890 3B

Southern Nevada Water Project.
W75-11913 3B

The Management of Water in Northern Ireland, with Particular Reference to Water Pollution,
W75-11939 5G

General Aspects of Water Supply and Treatment in Ontario,
W75-12067 5F

Design and Operating Criteria for Rural Water Systems,
W75-12126 6D

Treatment Plant to be Tested for Carcinogens,
W75-12130 5F

Water Supply.
W75-12297 6E

Method of Cleaning and Stimulating a Water Well,
W75-12301 3B

Liaison with Planning Authorities-A Vital Link,
W75-12335 6E

Proceedings of the Annual Conference of the British Columbia Water and Waste Association.
W75-12350 5F

Canadian Drinking Water Surveillance Programs, Panel Discussion,
W75-12355 5G

Canadian Drinking Water Standards Review, Alberta, Saskatchewan and Manitoba, Panel Discussion,
W75-12357 5G

Canadian Drinking Water Standards Review, British Columbia, Panel Discussion,
W75-12358 5G

Canadian Drinking Water Standards Review, Northwest Territories and Yukon Territory, Panel Discussion,
W75-12359 5G

WATER SUPPLY CONSTRUCTION
Water Supply.
W75-12297 6E

WATER SUPPLY OCCUPATIONS
Introduction of S433 (Bill for Safe Drinking Water).
W75-12280 6E

WATER TABLE
Diurnal Fluctuations of Water Tables Induced by Atmospheric Pressure Changes,
W75-12077 2G

Effective Use of High Water Table Areas for Sanitary Landfill. Volume I,
W75-12111 5E

WATER TABLE AQUIFERS
Artifical Groundwater Recharge, II. Rectangular Recharging Area,
W75-12097 4B

WATER TEMPERATURE
Quality of Surface Waters of the United States, 1970: Part 8. Western Gulf of Mexico Basins.
W75-11965 7C

Quality of Surface Waters of the United States, 1969: Part 8. Western Gulf of Mexico Basin.
W75-11966 7C

WATER TREATMENT
Recyclable Coagulants Look Promising for Drinking Water Treatment,.
W75-11909 5F

Apparatus for Cleaning Loose Filtering Material in Slow Water Filled Water Supply Filters,
W75-11935 5F

General Aspects of Water Supply and Treatment in Ontario,
W75-12067 5F

Water-Treatment Sludge Filtration Studies,
W75-12069 5D

Operational Variables and Limitations of Direct Filtration,
W75-12127 5F

Unusual Features in Plant Design.
W75-12146 5F

Control System for Showa Water Purification Plant, (In Japanese),
W75-12147 5F

Primary Solids/Liquid Separation.
W75-12153 5D

The $5 Billion Flush.
W75-12277 5D

Process for Raw Water Clarification,
W75-12300 5F

Water Treatment Device,
W75-12305 5F

Recirculating Resin Cleaning Chemical Feeder System for Water Softeners,
W75-12307 3D

Process for Demineralizing Water,
W75-12311 3A

Analysis of Reverse Osmosis Facilities, Greenfield, Iowa,
W75-12320 5F

Energy Conservation: An Essential and Urgent Problem for the Water Industry,
W75-12334 5D

Clearwell Quality Doesn't Last,
W75-12340 5F

Canadian Drinking Water Standards Review, Ontario's Programs, Panel Discussion,
W75-12356 5G

WATER TREATMENTS
Treatment Plant to be Tested for Carcinogens,
W75-12130 5F

WATER UPTAKE
Diurnal and Seasonal Soil Water Uptake and Flux Within a Bermudagrass Root Zone,
W75-12082 2D

WATER USERS
Design and Operating Criteria for Rural Water Systems,
W75-12126 6D

WATER UTILIZATION
Planning Models for Water System Development in Mississippi Communities,
W75-11851 6D

The Water Relations of Hemlock (Tsuga Canadensis): III. The Temperature Dependence of Water Exchange in a Pressure Bomb,
W75-11902 2I

Water Consumption Trends Within the Central and Southern Florida Flood Control District,
W75-12085 6D

Supplemental Water Use in the Everglades Agricultural Area,
W75-12086 3F

Design and Operating Criteria for Rural Water Systems,
W75-12126 6D

**ATER VAPOR**
An Infra-Red Psychrometer for Detecing Changes in the Humidity of Leaf Boundary Layers,
W75-12131 2I

**ATER WELLS**
Wanted: Fewer Bit, Casing Sizes, Reward: Many Benefits for Industry,
W75-11885 8C

Innovative Workover for Wasson Water Wells,
W75-11890 3B

Method of Cleaning and Stimulating a Water Well,
W75-12301 3B

Well Storage,
W75-12390 8B

Water-Level Fluctuations and Earthquakes on the San Andreas Fault Zone,
W75-12392 4B

Fresh Water Strata of Mississippi as Revealed by Electrical Log Studies,
W75-12399 4B

**ATER YIELD**
Innovative Workover for Wasson Water Wells,
W75-11890 3B

Stochastic Hydrologic Systems,
W75-12015 2A

**ATER YIELD IMPROVEMENT**
Method of Cleaning and Stimulating a Water Well,
W75-12301 3B

**ATERCOURSES (LEGAL ASPECTS)**
Gumz V. Bejes (Action by Adjoining Landowners for Injunction Against Flooding From Drainage and Irrigation Ditch).
W75-12290 6E

**ATERQUALITY**
Quality of Surface Waters of the United States, 1970: Part 8. Western Gulf of Mexico Basins.
W75-11965 7C

**AVES**
Tarshis v. Lahaina Investment Corp. (Responsibility of Owner of Beach Front Property to Warn of Surging Wave).
W75-12296 6E

**AVES (WATER)**
A Mini-Project for Avon Harbor, North Carolina,
W75-12045 8A

Power Conversion Apparatus for Utilizing the Force of Waves,
W75-12062 3E

Electric Generator Responsive to Waves in Bodies of Water,
W75-12186 3E

**EATHER MODIFICATION**
Weather Modification: Where are We Now and Where Should We Be Going. An Editorial Overview,
W75-12088 3B

On the Variability of 'Dynamic Seedability' as a Function of Time and Location Over South Florida: Part I. Spatial Variability,
W75-12089 3B

A Detailed Microphysical Simulation of Hygroscopic Seeding on the Warm Rain Process,
W75-12090 3B

Florida Area Cumulus Experiments 1970-1973 Rainfall Results,
W75-12091 3B

Small-Scale Variability of Hail and its Significance for Hail Prevention Experiments,
W75-12092 3B

Formation of Graupel,
W75-12093 3B

Hail Suppression Data from Western North Dakota, 1969-1972,
W75-12094 3B

Design of a Hail Suppression Project for Illinois,
W75-12095 3B

A Numerical Model of Precipitation from Seeded and Unseeded Cold Orographic Clouds,
W75-12098 3B

Testing of Cloud Seeding Materials at the Cloud Simulation and Aersol Laboratory, 1971-1973,
W75-12099 3B

An Explanation for the Unusual Nucleating Ability of Aerosols Produced from the AgI-NH4I-Acetone System,
W75-12100 3B

Analysis of Radar Observations of a Randomized Cloud Seeding Experiment,
W75-12101 3B

The Effect of Persistence of AgI on Randomized Weather Modification Experiments,
W75-12104 3B

On the Design and Evaluation of Cumulus Modification Experiments,
W75-12105 3B

Evaluation by Monte Carlo Tests of Effects of Cloud Seeding on Growing Season Rainfall in North Dakota,
W75-12106 3B

Bayesian and Classical Statistical Methods Applied to Randomized Weather Modification Experiments,
W75-12107 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part II: Techniques for the Physical Evaluation of Seeding,
W75-12108 3B

The Nature of Winter Clouds and Precipitation in the Cascade Mountains and Their Modification by Artificial Seeding. Part III: Case Studies of the Effects of Seeding,
W75-12109 3B

Potential of Precipitation Modification in Moderate to Severe Droughts,
W75-12110 2B

**WEIRS**
Seattle Project Calls for Rock Weirs.
W75-11922 4A

A Practical Proportional Weir,
W75-11937 8C

**WELFARE DISTRIBUTION**
Economic Growth Vs. the Environment. A Bibliography,
W75-12182 6G

**WELFARE (ECONOMICS)**
Externalities and Public Goods. A Bibliography,
W75-12179 6B

**WELL CASINGS**
Graphical Method Speeds Deviated Well Casing Design,
W75-11896 8G

U S GOVERNMENT PRINTING OFFICE · 1976 O - 210-951 (10

# CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

## Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

## INDEXES

- SUBJECT INDEX
- AUTHOR INDEX
- ORGANIZATIONAL INDEX
- ACCESSION NUMBER INDEX
